3. Osteoarthritis affects the weight-bearing joints and joints that receive the greatest stress, such as the hips, knees, lower vertebral column, and hands.
4. The cause of primary osteoarthritis is not known. Risk factors include trauma, aging, obesity, genetic changes, and smoking.

B. Assessment

1. The client experiences joint pain that diminishes after rest and intensifies after activity, noted early in the disease process.
2. As the disease progresses, pain occurs with slight motion or even at rest.
3. Symptoms are aggravated by temperature change and climate humidity.
4. Presence of Heberden's nodes or Bouchard's nodes (hands)
5. Joint swelling (may be minimal), crepitus, and limited range of motion
6. Difficulty getting up after prolonged sitting
7. Skeletal muscle disuse atrophy
8. Inability to perform activities of daily living
9. Compression of the spine as manifested by radiating pain, stiffness, and muscle spasms in one or both extremities

C. Pain

1. Administer medications as prescribed, such as acetaminophen or topical applications; if acetaminophen or topical agents do not relieve pain, NSAIDs may be prescribed. Muscle relaxants may also be prescribed for muscle spasms, especially those occurring in the back.
2. Prepare the client for corticosteroid injections into joints as prescribed.
3. Position joints in function position, and avoid flexion of knees and hips.
4. Immobilize the affected joint with a splint or brace until inflammation subsides.
5. Avoid large pillows under the head or knees.
6. Provide a bed or foot cradle to keep linen off feet and legs until inflammation subsides.
7. Instruct the client in the importance of moist heat, hot packs or compresses, and paraffin dips as prescribed.
8. Apply cold applications as prescribed when the joint is acutely inflamed.
9. Encourage adequate rest.

D. Nutrition

1. Encourage a well-balanced diet.
2. Maintain weight within normal range to decrease stress on the joints.

E. Physical mobility

1. Instruct the client to balance activity with rest and to participate in an exercise program that limits stress on affected joints.
2. Instruct the client that exercises should be active rather than passive and to stop exercise if pain occurs.
3. Instruct the client to limit exercise when joint inflammation is severe.

F. Surgical management

1. Osteotomy: The bone is resected to correct joint deformity, promote realignment, and reduce joint stress.
2. Total joint replacement or arthroplasty
   a. Total joint replacement is performed when all measures of pain relief have failed.
   b. Hips and knees are replaced most commonly.
   c. Total joint replacement is contraindicated in the presence of infection, advanced osteoporosis, or severe joint inflammation.

XVI. Osteoporosis

A. Description

1. Osteoporosis is a metabolic disease characterized by bone demineralization, with loss of calcium and phosphorus salts leading to fragile bones and the subsequent risk for fractures.
2. Bone resorption accelerates as bone formation slows.
3. Osteoporosis occurs most commonly in the wrist, hip, and vertebral column.
4. Osteoporosis can occur postmenopausally or as a result of a metabolic disorder or calcium deficiency.
5. The client may be asymptomatic until the bones become fragile and a minor injury or movement causes a fracture.
6. Primary osteoporosis
   a. Most often occurs in postmenopausal individuals; occurs in those with low testosterone levels
   b. Risk factors include decreased calcium intake, deficient estrogen, and sedentary lifestyle.
7. Secondary osteoporosis
   a. Causes include prolonged therapy with corticosteroids, thyroid-reducing medications, aluminum-containing antacids, or antiseizure medications.
   b. Associated with immobility, alcoholism, malnutrition, or malabsorption

B. Assessment

1. Risk factors (Box 61.6)
2. Possibly asymptomatic
3. Back pain that occurs after lifting, bending, or stooping
4. Back pain that increases with palpation
5. Pelvic or hip pain, especially with weight bearing
6. Problems with balance
7. Decline in height from vertebral compression
8. Kyphosis of the dorsal spine, also known as "dowager's hump"

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 61.6 Risk Factors for Osteoporosis

- Cigarette smoking
- Early menopause
- Excessive use of alcohol
- Family history
- Gender
- Increasing age
- Insufficient intake of calcium
- Sedentary lifestyle
- Thin, small frame
- White (European descent) or Asian race

9. Degeneration of lower thorax and lumbar vertebrae on radiographic studies

The client with osteoporosis is at risk for pathological fractures.

C. Interventions

1. Assess risk for and prevent injury in the client's personal environment.
   a. Assist the client to identify and correct hazards in the environment.
   b. Position household items and furniture to ensure an unobstructed walkway.
   c. Use side rails to prevent falls.
   d. Instruct in use of assistive devices such as a cane or walker.
   e. Encourage the use of a firm mattress.
2. Provide personal care to the client to reduce injuries.
   a. Move the client gently when turning and repositioning.
   b. Assist with ambulation if the client is unsteady.
   c. Provide gentle range-of-motion exercises.
   d. Apply a back brace as prescribed during an acute phase to immobilize the spine and provide spinal column support.
3. Provide the client with instructions to promote an optimal level of health and function.
   a. Instruct the client in the use of correct body mechanics.
   b. Instruct the client in exercises to strengthen abdominal and back muscles to improve posture and provide support for the spine.
   c. Instruct the client to avoid activities that can cause vertebral compression.
   d. Instruct the client to eat a diet high in protein, calcium, vitamins C and D, and iron.
   e. Instruct the client to avoid alcohol and coffee.
   f. Instruct the client to maintain an adequate fluid intake to prevent renal calculi.
4. Administer medications as prescribed to promote bone strength and decrease pain.

XVII. Gout

A. Description

1. Gout is a systemic disease in which urate crystals deposit in joints and other body tissues.
2. Gout results from abnormal amounts of uric acid in the body.
3. Primary gout results from a disorder of purine metabolism.
4. Secondary gout involves excessive uric acid in the blood, caused by another disease.

B. Phases

1. Asymptomatic: Client has no symptoms, but serum uric acid level is elevated.
2. Acute: Client has excruciating pain and inflammation of one or more small joints, especially the great toe.
3. Intermittent: Client has intermittent periods without symptoms between acute attacks.
4. Chronic: Results from repeated episodes of acute gout
   a. Results in deposits of urate crystals under the skin
   b. Results in deposits of urate crystals within major organs, such as the kidneys, leading to organ dysfunction

C. Assessment

1. Swelling and inflammation of the joints, leading to excruciating pain
2. Tophi: Hard, irregularly shaped nodules in the skin containing chalky deposits of sodium urate
3. Low-grade fever, malaise, and headache
4. Pruritus from urate crystals in the skin
5. Presence of renal stones from elevated uric acid levels

D. Interventions

1. Provide a low-purine diet as prescribed, avoiding foods such as organ meats, wines, and aged cheese.
2. Encourage a high fluid intake of 2000 mL/day to prevent stone formation.
3. Encourage a weight reduction diet if required.
4. Instruct the client to avoid alcohol and starvation diets, because they may precipitate a gout attack.
5. Increase urinary pH (above 6) by eating alkaline ash foods (e.g., green beans, broccoli).
6. Provide bed rest during acute attacks, with the affected extremity elevated.
7. Monitor joint range-of-motion ability and appearance of joints.
8. Position the joint in mild flexion during acute attack.
9. Protect the affected joint from excessive movement or direct contact with sheets or blankets.
10. Provide heat or cold for local treatments to affected joint as prescribed.
11. Administer medications such as analgesic, antiinflammatory, and uricosuric agents as prescribed.

PRACTICE QUESTIONS

1. The nurse is conducting health screening for osteoporosis. Which client is at greatest risk of developing this problem?
   1. A 25-year-old client who runs
   2. A 36-year-old client who has asthma
   3. A 70-year-old client who consumes excess alcohol
   4. A sedentary 65-year-old client who smokes cigarettes

2. The nurse has given instructions to a client who sustained a ligament injury who is returning home after knee arthroscopy. Which statement by the client indicates that the instructions are understood?
   1. "I can resume regular exercise tomorrow."
   2. "I can't eat food for the remainder of the day."
   3. "I need to stay off the leg entirely for the rest of the day."
   4. "I need to report a fever, redness around my incisions, or persistent drainage to my health care provider."

3. The nurse witnessed a vehicle hit a pedestrian. The victim is dazed and tries to get up. A leg appears fractured. Which intervention would the nurse take?
   1. Try to reduce the fracture manually.
   2. Assist the victim to get up and walk to the sidewalk.
   3. Leave the victim for a few moments to call an ambulance.
   4. Stay with the victim and encourage the victim to remain still.

4. Which cast care instructions would the nurse provide to a client who just had a plaster cast applied to the right forearm? **Select all that apply.**
   - ❑ 1. Keep the cast clean and dry.
   - ❑ 2. Allow the cast 24 to 72 hours to dry.
   - ❑ 3. Keep the cast and extremity elevated.
   - ❑ 4. Expect tingling and numbness in the extremity.
   - ❑ 5. Use a hair dryer set on a warm to hot setting to dry the cast.
   - ❑ 6. Use a soft, padded object that will fit under the cast to scratch the skin under the cast.

5. The nurse is evaluating a client in skeletal traction. When evaluating the pin sites, the nurse would be **most** concerned with which finding?
   1. Redness around the pin sites
   2. Pain on palpation at the pin sites
   3. Thick, yellow drainage from the pin sites
   4. Clear, watery drainage from the pin sites

6. The nurse is assessing the casted extremity of a client. Which sign is indicative of infection?
   1. Dependent edema
   2. Diminished distal pulse
   3. Presence of a "hot spot" on the cast
   4. Coolness and pallor of the extremity

7. A client has sustained a closed fracture and has just had a cast applied to the affected arm. The client is complaining of intense pain. The nurse elevates the limb, applies an ice bag, and administers an analgesic, with little relief. Which problem may be causing this pain?
   1. Infection under the cast
   2. The anxiety of the client
   3. Impaired tissue perfusion
   4. The recent occurrence of the fracture

8. The nurse is admitting a client with multiple trauma injuries to the nursing unit. The client has a leg fracture and had a plaster cast applied. Which position would be **best** for the casted leg?
   1. Elevated for 3 hours, then flat for 1 hour
   2. Flat for 3 hours, then elevated for 1 hour
   3. Flat for 12 hours, then elevated for 12 hours
   4. Elevated on pillows continuously for 24 to 48 hours

9. A client is being discharged to home after application of a plaster leg cast. Which statement indicates that the client understands proper care of the cast?
   1. "I need to avoid getting the cast wet."
   2. "I need to cover the casted leg with warm blankets."
   3. "I need to use my fingertips to lift and move my leg."
   4. "I need to use something like a padded coat hanger end to scratch under the cast if it itches."

10. A client being measured for crutches asks the nurse why the crutches cannot rest up underneath the arm for extra support. The nurse responds, knowing that which would **most likely** result from this improper crutch measurement?
    1. A fall and further injury
    2. Injury to the brachial plexus nerves
    3. Skin breakdown in the area of the axilla
    4. Impaired range of motion while the client ambulates

11. The nurse has given the client instructions about crutch safety. Which statements indicate that the client understands the instructions? **Select all that apply.**
    - ❑ 1. "I would not use someone else's crutches."
    - ❑ 2. "I need to remove any scatter rugs at home."
    - ❑ 3. "I can use crutch tips even when they are wet."
    - ❑ 4. "I need to have spare crutches and tips available."
    - ❑ 5. "When I'm using the crutches, my arms need to be completely straight."

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

12. The nurse is caring for a client being treated for fat embolus after multiple fractures. Which data would the nurse evaluate as the **most** favorable indication of resolution of the fat embolus?
    1. Clear mentation
    2. Minimal dyspnea
    3. Oxygen saturation of 85%
    4. Arterial oxygen level of 78 mm Hg

13. The nurse has conducted teaching with a client in an arm cast about the signs and symptoms of compartment syndrome. The nurse determines that the client understands the information if the client states that they will report which **early** symptom of compartment syndrome?
    1. Cold, bluish-colored fingers
    2. Numbness and tingling in the fingers
    3. Pain that increases when the arm is dependent
    4. Pain that is out of proportion to the severity of the fracture

14. A client with diabetes mellitus has had a right below-knee amputation. Given the client's history of diabetes mellitus, which complication is the client at **most** risk for after surgery?
    1. Hemorrhage
    2. Edema of the residual limb
    3. Slight redness of the incision
    4. Separation of the wound edges

15. The nurse is caring for a client who had an above-knee amputation 2 days ago. The residual limb was wrapped with an elastic compression bandage, which has come off. Which **immediate** action would the nurse take?
    1. Apply ice to the site.
    2. Call the primary health care provider (PHCP).
    3. Rewrap the residual limb with an elastic compression bandage.
    4. Apply a dry, sterile dressing, and elevate the residual limb on one pillow.

16. A client is complaining of low back pain that radiates down the left posterior thigh. The nurse would ask the client if the pain is worsened or aggravated by which factor?
    1. Bed rest
    2. Ibuprofen
    3. Bending or lifting
    4. Application of heat

17. The nurse is caring for a client who has had spinal fusion, with insertion of hardware. The nurse would be **most** concerned with which assessment finding?
    1. Temperature of 101.6° F (38.7° C) orally
    2. Complaints of discomfort during repositioning
    3. Old bloody drainage outlined on the surgical dressing
    4. Discomfort during coughing and deep-breathing exercises

18. The nurse is caring for a client with a diagnosis of gout. Which laboratory value would the nurse expect to note in the client?
    1. Calcium level of 9.0 mg/dL (2.25 mmol/L)
    2. Uric acid level of 9.0 mg/dL (540 mcmol/L)
    3. Potassium level of 4.1 mEq/L (4.1 mmol/L)
    4. Phosphorus level of 3.1 mg/dL (1.0 mmol/L)

19. A client with a hip fracture asks the nurse what is involved with Buck's (extension) traction, which is being applied before surgery. The nurse would provide which information to the client?
    1. Allows bony healing to begin before surgery and involves pins and screws
    2. Provides rigid immobilization of the fracture site and involves pulleys and wheels
    3. Lengthens the fractured leg to prevent severing of blood vessels and involves pins and screws
    4. Provides comfort by reducing muscle spasms, provides fracture immobilization, and involves pulleys and wheels

Telegram & Insta: NCLEX_RN_Edu

ANSWERS

1. *Answer:* 4

Rationale: Risk factors for osteoporosis include gender, being postmenopausal, advanced age, a low-calcium diet, excessive alcohol intake, being sedentary, and smoking cigarettes. Long-term use of corticosteroids, anticonvulsants, and/or furosemide also increases the risk.

Test-Taking Strategy: Focus on the subject, risk factors for osteoporosis. The 25-year-old client who runs (exercises using the long bones) has negligible risk. The 36-year-old client with asthma is eliminated next because the only risk factor might be long-term corticosteroid use (if prescribed) to treat the asthma. Of the remaining options, the 65-year-old client has higher risk (age, gender, postmenopausal, sedentary, smoking) than the 70-year-old client (age, alcohol consumption).

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 985.

2. *Answer:* 4

Rationale: After arthroscopy, the client usually can walk carefully on the leg once sensation has returned. The client is instructed to avoid strenuous exercise for the length of time prescribed by the surgeon. The client may resume the usual

Telegram & Insta: NCLEX_RN_Edu

diet. Signs and symptoms of infection need to be reported to the primary health care provider.

Test-Taking Strategy: Focus on the **subject,** teaching points following knee arthroscopy. Recalling the general client teaching points related to surgical procedures and that a risk for infection exists after a surgical procedure will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 1012, 1015.

3. *Answer:* 4

Rationale: With a suspected fracture, the victim is not moved unless it is dangerous to remain in that spot. The nurse would remain with the victim and have someone else call for emergency help. A fracture is not reduced at the scene. Before the victim is moved, the site of fracture is immobilized to prevent further injury.

Test-Taking Strategy: Eliminate options 1 and 2 first because they are **comparable or alike** in that either of these options could result in further injury to the victim. Of the remaining options, the more prudent action would be for the nurse to remain with the victim and have someone else call for emergency assistance.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1035.

4. *Answer:* 1, 2, 3

Rationale: A plaster cast takes 24 to 72 hours to dry (synthetic casts dry in 20 minutes). The cast and extremity need to be elevated to reduce edema if prescribed. A wet cast is handled with the palms of the hand until it is dry, and the extremity is turned (unless contraindicated) so that all sides of the wet cast will dry. A cool setting on the hair dryer can be used to dry a plaster cast (heat cannot be used on a plaster cast because the cast heats up and burns the skin). The cast needs to be kept clean and dry, and the client is instructed not to stick anything under the cast because of the risk of breaking skin integrity. The client is instructed to monitor the extremity for circulatory impairment, such as pain, swelling, discoloration, tingling, numbness, coolness, or diminished pulse. The primary health care provider is notified immediately if circulatory impairment occurs.

Test-Taking Strategy: Focus on the **subject,** a plaster cast. Recalling that edema occurs following a fracture and recalling the complications associated with a cast will assist you in answering the question.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 1453.

5. *Answer:* 3

Rationale: The nurse would monitor for signs of infection such as inflammation, purulent (thick white or yellow) drainage, and pain at the pin site. However, some degree of inflammation, pain at the pin site, and serous drainage would be expected; the nurse would correlate assessment findings with other clinical findings, such as fever, elevated white blood cell count, and changes in vital signs. Additionally, the nurse would compare any findings to baseline findings to determine if there were any changes.

Test-Taking Strategy: Note the **strategic word,** *most*. Determine if an **abnormality exists.** Recall that purulent drainage is indicative of infection and that some degree of pain, inflammation, and serous drainage would be expected.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 1037-1038.

6. *Answer:* 3

Rationale: Signs of infection under a casted area include odor or purulent drainage from the cast or the presence of "hot spots," which are areas of the cast that are warmer than others. The primary health care provider needs to be notified if any of these are noted. Signs of impaired circulation in the distal limb include coolness and pallor of the skin, diminished distal pulse, and edema.

Test-Taking Strategy: Focus on the **subject,** signs of infection. Think about what you would expect to note with infection—redness, swelling, heat, and purulent drainage. With this in mind, you can eliminate options 2 and 4 easily. From the remaining options, remember that "dependent edema" is not necessarily indicative of infection. Swelling would be continuous. The hot spot on the cast could signify infection underneath that area.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1037.

7. *Answer:* 3

Rationale: Most pain associated with fractures can be minimized with rest, elevation, application of cold, and administration of analgesics. Pain that is not relieved by these measures needs to be reported to the primary health care provider because pain unrelieved by medications and other measures may indicate neurovascular compromise. Because this is a new closed fracture and cast, infection would not have had time to set in. Intense pain after casting is normally not associated with anxiety or the recent occurrence of the injury. Treatment following the fracture should assist in relieving the pain associated with the injury.

Test-Taking Strategy: Focus on the **subject,** intense pain, and focus on the **data in the question.** Use of the **ABCs—airway, breathing, and circulation**—will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1037.

8. *Answer:* 4

Rationale: A casted extremity is elevated continuously for the first 24 to 48 hours to minimize swelling and promote venous drainage. Options 1, 2, and 3 are incorrect.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Test-Taking Strategy: Note the **strategic word,** *best*. Recalling that edema is a concern following an injury and knowledge of the effects of gravity on edema will direct you to the correct option.
Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1037.

9. *Answer:* 1
Rationale: A plaster cast must remain dry to keep its strength. The cast needs to be handled with the palms of the hands, not the fingertips, until fully dry; using the fingertips results in indentations in the cast and skin pressure under the cast. Air needs to circulate freely around the cast to help it dry; the cast also gives off heat as it dries. The client would never scratch under the cast because of the risk of altered skin integrity; the client may use a hair dryer on the cool setting to relieve an itch.
Test-Taking Strategy: Focus on the **subject,** client understanding about cast care. Knowing that a wet cast can be dented with the fingertips, causing pressure underneath, helps eliminate option 3 first. Knowing that the cast needs to dry helps eliminate option 2 next. Option 4 is dangerous to skin integrity and is also eliminated. Remember that plaster casts, once they have dried after application, should not become wet.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 1458.

10. *Answer:* 2
Rationale: Crutches are measured so that the tops are two to three finger widths from the axillae. This ensures that the client's axillae are not resting on the crutch or bearing the weight of the crutch, which could result in injury to the nerves of the brachial plexus. Although the conditions in options 1, 3, and 4 can occur, they are not the most likely result from resting the axilla directly on the crutches.
Test-Taking Strategy: Note the **strategic words,** *most likely*, and focus on the **data in the question.** Recalling the risk associated with brachial nerve plexus injury will direct you to the correct option.
Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing.* (10th ed.). St. Louis: Elsevier. pp. 798-799.

11. *Answer:* 1, 2, 4
Rationale: The client needs to use only crutches measured for the client. When assessing for home safety, the nurse ensures that the client knows to remove any scatter rugs and to avoid walking on highly waxed floors. The tips need to be inspected for wear, and spare crutches and tips should be available if needed. Crutch tips should remain dry. If crutch tips get wet, the client needs to dry them with a cloth or paper towel. When walking with crutches, both elbows need to be flexed not more than 30 degrees when the palms are on the handle.
Test-Taking Strategy: Focus on the **subject,** client understanding of instructions for using crutches. Visualize each option and think about the safety associated with each instruction. This will assist in answering correctly.
Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing.* (10th ed.). St. Louis: Elsevier. p. 798.

12. *Answer:* 1
Rationale: An altered mental state is an early indication of fat emboli; therefore, clear mentation is a good indicator that a fat embolus is resolving. Eupnea, not minimal dyspnea, is a normal sign. Arterial oxygen levels need to be 80 to 100 mm Hg. Oxygen saturation needs to be higher than 95%.
Test-Taking Strategy: Note the **strategic word,** *most*. Knowing that the arterial oxygen and oxygen saturation levels are below normal helps eliminate options 3 and 4. Dyspnea, even at a minimal level, is not normal, so eliminate option 2.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 1461.

13. *Answer:* 2
Rationale: The earliest symptom of compartment syndrome is paresthesia (numbness and tingling in the fingers). Other symptoms include pain unrelieved by opioids, pain that increases with limb elevation, and pallor and coolness to the distal limb. Cyanosis is a late sign. Pain that is out of proportion to the severity of the fracture, along with other symptoms associated with the pain, is not an early manifestation.
Test-Taking Strategy: Note the **strategic word,** *early*. Knowing that compartment syndrome is characterized by insufficient circulation and ischemia caused by pressure will direct you to the correct option.
References: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. pp. 962-963; Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1031.

14. *Answer:* 4
Rationale: Clients with diabetes mellitus are more prone to wound infection, wound separation, and delayed wound healing because of the disease. Postoperative hemorrhage and edema of the residual limb are complications in the immediate postoperative period that apply to any client with an amputation. Slight redness of the incision is considered normal, as long as the incision is dry and intact.
Test-Taking Strategy: Note the **strategic word,** *most*, and focus on the **subject**, complications following surgery for the client with diabetes mellitus. Recalling that diabetes mellitus increases the client's chances of developing infection and delayed wound healing will direct you to the correct option.
References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 1407-1409; Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1470-1471.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

15. *Answer:* 3

Rationale: If the client with an amputation has a cast or elastic compression bandage that slips off, the nurse must wrap the residual limb immediately with another elastic compression bandage. Otherwise, excessive edema will form rapidly, which could cause a significant delay in rehabilitation. If the client had a cast that slipped off, the nurse would have to call the PHCP so that a new one could be applied. Elevation on one pillow is not going to impede the development of edema greatly once compression is released. Ice would be of limited value in controlling edema from this cause. If the PHCP were called, the prescription likely would be to reapply the compression dressing anyway.

Test-Taking Strategy: Note the **strategic word,** *immediate*, and focus on the **data in the question**. Recalling that excessive edema can form rapidly in the residual limb will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 1050.

16. *Answer:* 3

Rationale: Low back pain that radiates down one leg (sciatica) is consistent with herniated lumbar disc. The nurse assesses the client to see whether the pain is aggravated by events that increase intraspinal pressure, such as bending, lifting, sneezing, and coughing, or by lifting the leg straight up while supine (straight leg-raising test). Bed rest, heat (or sometimes ice), and nonsteroidal antiinflammatory drugs (NSAIDs) usually relieve back pain.

Test-Taking Strategy: Focus on the **subject,** factors that aggravate back pain. Think about how each item in the options would relieve or exacerbate back pain. Recall that bed rest, heat (or sometimes ice), and NSAIDs usually relieve back pain, whereas bending, lifting, and straining aggravate it.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 888.

17. *Answer:* 1

Rationale: The nursing assessment conducted after spinal surgery is similar to that done after other surgical procedures. For this specific type of surgery, the nurse assesses the neurovascular status of the lower extremities, watches for signs and symptoms of infection, and inspects the surgical site for evidence of cerebrospinal fluid leakage (drainage is clear and tests positive for glucose). A mild temperature is expected after insertion of hardware, but a temperature of 101.6° F (38.7° C) should be reported.

Test-Taking Strategy: Note the **strategic word,** *most*. Determine if an **abnormality exists.** Thus, you are looking for the option that has the greatest deviation from normal. Options 2 and 4 are expected after surgery; although the nurse tries to minimize discomfort, the client is likely to have some discomfort, even with proper analgesic use. The words *old* and *outlined* in option 3 indicate that this is not a new occurrence. This leaves the temperature of 101.6° F (38.7° C), which is excessive and needs to be reported.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 891-892.

18. *Answer:* 2

Rationale: In addition to the presence of clinical manifestations, gout is diagnosed by the presence of persistent hyperuricemia. A normal value ranges from 2.7 to 8.5 mg/dL (160–501 mcmol/L). Options 1, 3, and 4 indicate normal laboratory values. In addition, the presence of uric acid in an aspirated sample of synovial fluid confirms the diagnosis.

Test-Taking Strategy: Focus on the **subject,** manifestation of gout. Use knowledge of normal laboratory values. Recalling that increased uric acid levels occur in gout and noting that the correct option has the only abnormal value will assist you in answering the question.

References: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1514-1515; Pagana, K., Pagana, T., & Pagana, T.N. (2021). *Mosby's diagnostic and laboratory test reference.* (15th ed.). St. Louis: Elsevier. pp. 930-932.

19. *Answer:* 4

Rationale: Buck's (extension) traction is a type of skin traction often applied after hip fracture before the fracture is reduced in surgery. Traction reduces muscle spasms and helps immobilize the fracture. Traction does not allow for bony healing to begin or provide rigid immobilization. Traction does not lengthen the leg for the purpose of preventing blood vessel severance. This type of traction involves pulleys and wheels, not pins and screws.

Test-Taking Strategy: Focus on the **subject,** use of traction following a hip fracture. Read each option carefully and note that each option has more than one part. All parts of the option need to be correct in order for the answer to be correct. Noting the words *provides comfort* and *fracture immobilization* will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1452-1453.

CHAPTER 62

Musculoskeletal Medications

Contributors: Lisa Nicholas, MSN, RN
Sarah R. Jean Baptiste, MS, PA-C
James Guilbault, PharmD, BS, RPh

Telegram & Insta: NCLEX_RN_Edu

PRIORITY CONCEPTS **Inflammation; Safety**

I. Skeletal Muscle Relaxants

A. Description

1. Skeletal muscle relaxants (Box 62.1) act directly on the neuromuscular junction or act indirectly on the central nervous system (CNS).
2. Centrally acting muscle relaxants depress neuron activity in the spinal cord or brain.
3. Peripherally acting muscle relaxants act directly on the skeletal muscles, interfering with calcium release from muscle tubules and thus preventing the fibers from contracting.
4. Skeletal muscle relaxants are used to prevent or relieve muscle spasms and treat spasticity associated with spinal cord disease or lesions, acute painful musculoskeletal conditions, and chronic debilitating disorders such as multiple sclerosis, stroke (brain attacks), or cerebral palsy.
5. Skeletal muscle relaxants are contraindicated in clients with severe liver, renal, or heart disease; these medications are often metabolized in the liver or excreted by the kidneys.
6. Skeletal muscle relaxants should not be taken with CNS depressants, such as barbiturates, opioids, alcohol, sedatives, hypnotics, or tricyclic antidepressants, unless specifically prescribed.

B. Side and adverse effects

1. Dizziness and hypotension
2. Drowsiness and muscle weakness
3. Dry mouth
4. Gastrointestinal upset
5. Photosensitivity
6. Liver toxicity

C. Interventions

1. Obtain a medical history and ask about current medications being taken.
2. Monitor vital signs.
3. Monitor for CNS effects.
4. Assess for risk of injury.
5. Assess involved joints and muscles for pain and mobility.
6. Monitor renal function studies.
7. Instruct the client to take the medication with food to decrease gastrointestinal upset.
8. Instruct the client to report adverse effects.
9. Instruct the client to avoid alcohol and CNS depressants.
10. Instruct the client to avoid activities requiring alertness, such as driving or operating equipment.

Monitor liver function tests when a client is taking a skeletal muscle relaxant, because hepatotoxicity can occur.

D. Nursing considerations

1. Baclofen
   - **a.** Baclofen causes CNS effects such as drowsiness, dizziness, weakness, and fatigue and also causes nausea, constipation, and urinary retention.
   - **b.** Administer with caution in the client with renal or hepatic dysfunction or a seizure disorder.
   - **c.** Baclofen can be administered by the primary health care provider (PHCP) through intrathecal infusion using an implantable pump or by direct intrathecal administration over 1 minute.
   - **d.** Instruct the client with an implantable pump to maintain medication refill appointments to prevent the pump from emptying and experiencing sudden withdrawal symptoms, which could be life-threatening.

Telegram & Insta: NCLEX_RN_Edu

BOX 62.1 Skeletal Muscle Relaxants

- Baclofen
- Carisoprodol
- Chlorzoxazone
- Cyclobenzaprine
- Dantrolene
- Diazepam
- Metaxalone
- Methocarbamol
- Orphenadrine
- Tizanidine

2. Carisoprodol
   a. Advise the client to take the medication with food to prevent gastrointestinal upset.
   b. Instruct the client to report any rash or hypersensitivity to the PHCP.
3. Chlorzoxazone
   a. Monitor the client for hypersensitivity reactions such as urticaria, redness or itching, and possibly angioedema.
   b. Chlorzoxazone may cause malaise and may cause the urine to turn orange or red.
   c. Can cause **hepatitis** and hepatic necrosis.
4. Cyclobenzaprine
   a. Cyclobenzaprine is contraindicated in clients who have received monoamine oxidase inhibitors (MAOIs) within 14 days of initiation of cyclobenzaprine therapy and in clients with cardiac disorders (see Clinical Judgment: Take Action Box).
   b. Cyclobenzaprine has significant anticholinergic (atropine-like) effects and should be used with caution in clients with a history of urinary retention, angle-closure **glaucoma**, or increased intraocular pressure.
   c. Cyclobenzaprine should be used only for short-term therapy (2 to 3 weeks).
5. Dantrolene
   a. Dantrolene acts directly on skeletal muscles to relieve spasticity.
   b. Liver damage is the most serious adverse effect.
   c. Liver function values should be monitored before the initiation of treatment and during treatment.
   d. Dantrolene can cause gastrointestinal bleeding, urinary frequency, impotence, photosensitivity, rash, and muscle weakness.
   e. Instruct the client to wear protective clothing when in the sun.
   f. Instruct the client to notify the PHCP if rash, bloody or tarry stools, or yellow discoloration of the skin or eyes occurs.
6. Diazepam
   a. Acts on the CNS to suppress spasticity; does not affect skeletal muscle directly
   b. Sedation commonly occurs.
7. Methocarbamol
   a. The parenteral form is contraindicated in clients with renal impairment.
   b. The parenteral form can cause hypotension, bradycardia, anaphylaxis, and seizures, especially when the medication is given too rapidly.
   c. Monitor site for extravasation, which can result in thrombophlebitis and tissue sloughing.
   d. Methocarbamol may cause the urine to turn brown, black, or green.
   e. Inform the client to notify the PHCP if blurred vision, nasal congestion, urticaria, or rash occurs.
8. Tizanidine and metaxalone: Can cause liver damage
9. Orphenadrine has significant anticholinergic (atropine-like) effects and should be used with caution in clients with a history of urinary retention, angle-closure glaucoma, or increased intraocular pressure.

⚠ Safety is a primary concern when the client is taking a skeletal muscle relaxant, because these medications cause drowsiness.

CLINICAL JUDGMENT: TAKE ACTION

A client is seen in the health care clinic complaining of muscle spasms following a back injury that occurred when moving furniture at home. The primary health care provider suggests cyclobenzaprine to relieve the muscle spasms. The nurse reviews the client's medical record and notes that the client is currently taking phenelzine to treat depression. The nurse would take the following actions:

- Seek health information from the client and confirm that the client is currently taking phenelzine
- Notify the primary health care provider that the client is taking a monoamine oxidase inhibitor, a contraindication to taking cyclobenzaprine
- Document the information and that the primary health care provider was notified

II. Antigout Medications

A. Description
   1. Antigout medications (allopurinol, colchicine, probenecid, febuxostat) reduce uric acid production and increase uric acid excretion (uricosuric) to prevent or relieve gout or to manage hyperuricemia.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Nonsteroidal antiinflammatory drugs (NSAIDs) are used for their antiinflammatory effects and to relieve pain during an acute gouty attack (see Chapter 60 for information on NSAIDs).
3. Glucocorticoids may be prescribed to reduce inflammation during an acute gout attack (see Chapter 48 for information on glucocorticoids).
4. Antigout medications should be used cautiously in clients with gastrointestinal, renal, cardiac, or hepatic disease.

B. Side and adverse effects
1. Headaches
2. Nausea, vomiting, and diarrhea
3. Blood dyscrasias, such as bone marrow depression
4. Flushed skin and rash
5. Uric acid kidney stones
6. Sore gums
7. Metallic taste

C. Interventions
1. Assess serum uric acid levels.
2. Monitor intake and output.
3. Maintain a fluid intake of at least 2000 to 3000 mL/day to prevent kidney stones.
4. Monitor complete blood cell count and renal and liver function studies.
5. Instruct the client to avoid alcohol and caffeine, because these products can increase uric acid levels.
6. Encourage the client to comply with therapy to prevent elevated uric acid levels, which can trigger a gout attack.
7. Instruct the client to avoid foods high in purine as prescribed, such as wine, alcohol, organ meats, sardines, salmon, scallops, and gravy.
8. Instruct the client to take the medication with food to decrease gastric irritation.
9. Instruct the client to report adverse effects to the PHCP.
10. Caution the client not to take aspirin with these medications, because this could trigger a gout attack.

D. Nursing considerations
1. Allopurinol
   a. Can increase the effect of warfarin and oral hypoglycemic agents
   b. Instruct the client not to take large doses of vitamin C while taking allopurinol, because kidney stones may occur.
   c. Hypersensitivity syndrome (rare) can occur, characterized by rash, fever, eosinophilia, and liver and kidney alterations (medication is withheld and the PHCP is notified).
   d. Advise the client to minimize exposure to sunlight and have an annual eye examination, because visual changes can occur from prolonged use of allopurinol.
2. Colchicine
   a. Used with caution in older clients, debilitated clients, and clients with cardiac, renal, and/or gastrointestinal disease
   b. If gastrointestinal symptoms occur (nausea, vomiting, diarrhea, and abdominal pain), the medication is withheld and the PHCP is notified.
3. Probenecid
   a. Mild gastrointestinal effects can occur and can be reduced by taking the medication with food.
   b. Aspirin and other salicylates interfere with the uricosuric action of the medication.

The concurrent use of antigout medications and aspirin causes elevated uric acid levels; the client should be instructed to take acetaminophen if prescribed rather than aspirin.

III. Antiarthritic Medications (Box 62.2)

A. Description (Fig. 62.1)
1. Rheumatoid arthritis occurs as inflammation progresses into the synovia, cartilage, and bone; if this inflammation is not controlled, it will lead to joint destruction, thus affecting client mobility and comfort.
2. The focus of treatment is early diagnosis and aggressive treatment to preserve joint function.
3. Medication therapy includes NSAIDs, glucocorticoids, disease-modifying antirheumatic drugs (DMARDs), and biologic DMARDs.
4. Refer to Chapter 60 for information on NSAIDs and Chapter 48 for information on glucocorticoids.
5. Biologic DMARDs include abatacept, anakinra, adalimumab, etanercept, infliximab, and rituximab; side and adverse effects include injection site reactions, headache, rashes, nausea, fatigue, abdominal pain, increased risk of serious infections/tuberculosis, and increased risk of malignancy.
6. DMARDs include hydroxychloroquine, methotrexate, leflunomide, azathioprine, cyclosporine, and sulfasalazine; side and adverse effects include injection site inflammation and pain, ecchymosis, and edema; neutropenia, low platelets, and infection; fatigue, headache, nausea, vomiting, and flulike symptoms; liver damage; and allergic response.
7. Gold salts: The use of gold salts has decreased, but their purpose is to reduce the progression of joint damage caused by arthritic processes. Gold toxicity, characterized by pruritus, rash, metallic taste, stomatitis, and diarrhea, can occur; if

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

toxicity occurs, dimercaprol may be prescribed to enhance gold excretion.

B. DMARDs

1. Description

a. DMARDs are effective antirheumatic medications that are used to slow the degenerative effects of the disorder.

b. DMARDs are usually prescribed secondary to NSAIDs but are often the first choice in the treatment of severe arthritis.

2. Interventions

a. Instruct the client to monitor for signs of infection and report signs to the PHCP.

b. Monitor the injection site for signs of irritation, pain, inflammation, and swelling.

c. Instruct the client to consult with the PHCP before receiving live vaccines and to avoid exposure to infections.

d. Inform the client about the importance of laboratory tests for neutrophil counts, white blood cell counts, and platelet counts before initiation of treatment and during treatment.

3. Abatacept

a. Generally well tolerated. Its most common adverse effects are headache, upper respiratory infection, nasopharyngitis, and nausea.

b. It suppresses immune function; therefore, it poses a risk for severe infection. Clients need to be educated on infection risk and need to report suspected infection to their PHCP.

4. Anakinra: Injection site reactions are common (pruritus, erythema, rash, pain).

5. Adalimumab

a. Injection site reactions are common.

b. Has been associated with neurological injury (numbness, tingling, dizziness, visual disturbances, weakness in the legs)

6. Azathioprine: Immunosuppressive and antiinflammatory actions; toxic effects include hepatitis and blood dyscrasias.

7. Cyclosporine: Immunosuppressive actions; can cause nephrotoxicity

8. Etanercept

a. Injection site reactions are common.

b. Poses a risk for heart failure; has been associated with CNS demyelinating disorders and hematological disorders

9. Hydroxychloroquine: Associated with retinal damage; inform the client to contact the PHCP if visual disturbances occur.

10. Leflunomide: Side and adverse effects include diarrhea, respiratory infection, reversible alopecia, rash, and nausea; medication is hepatotoxic.

11. Methotrexate: Can cause hepatic fibrosis, bone marrow suppression, gastrointestinal ulceration, and pneumonitis

12. Penicillamine: Can cause bone marrow suppression and autoimmune disorders

13. Infliximab: Can cause infusion reactions (fever, chills, pruritus, urticaria, chest pain); medication is hepatotoxic.

14. Rituximab: Can cause increased thirst or urination, swelling of the hands or feet, or tingling of the hands or feet; the PHCP should be notified if any of these occur.

BOX 62.2 Antiarthritic Medications

- Abatacept
- Adalimumab
- Anakinra
- Azathioprine
- Cyclosporine
- Etanercept
- Hydroxychloroquine
- Infliximab
- Leflunomide
- Methotrexate
- Penicillamine
- Rituximab
- Sulfasalazine
- Tofacitinib

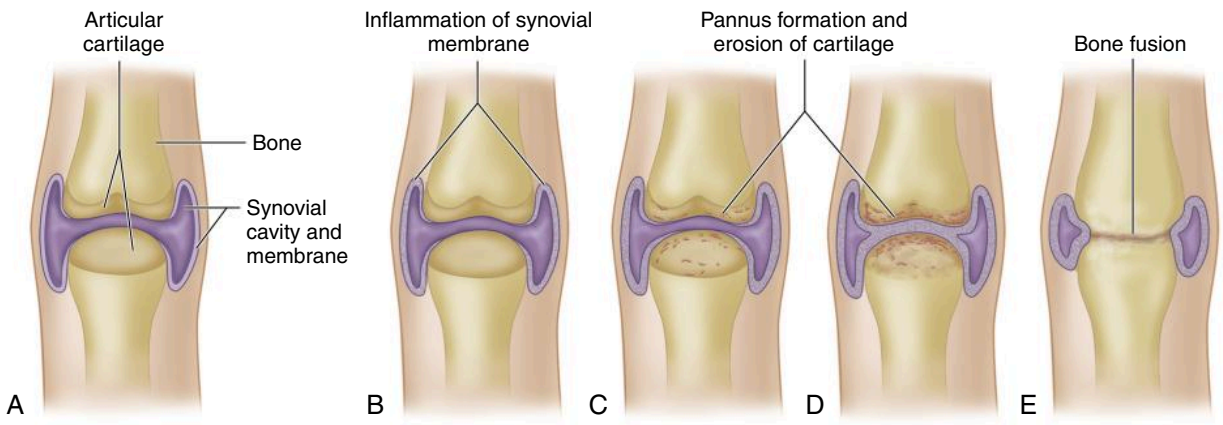

FIG. 62.1 Progressive joint degeneration in rheumatoid arthritis. **A,** Healthy joint. **B,** Inflammation of synovial membrane. **C,** Onset of pannus formation and cartilage erosion. **D,** Pannus formation progresses and cartilage deteriorates further. **E,** Complete destruction of joint cavity, together with fusion of articulating bones.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

15. Sulfasalazine: Can cause gastrointestinal and dermatological reactions, bone marrow suppression, and hepatitis
16. Tofacitinib: Contraindicated for clients with an active infection, recent live immunization administration, hepatic impairment, or those who are lactating.

C. NSAIDs may be prescribed for their antiinflammatory and analgesic effects (see Chapter 60 for information on NSAIDs).

D. Glucocorticoids may be prescribed for their antiinflammatory effects (see Chapter 48 for information on glucocorticoids).

IV. Medications to Prevent and Treat Osteoporosis

A. Description

1. Osteoporosis is characterized by decreased bone mass and increased bone fragility.
2. Calcium and vitamin D supplementation can reduce the risk of osteoporosis; calcium maximizes bone growth early in life and maintains bone integrity later in life, and vitamin D ensures calcium absorption (see Chapter 48 for information on calcium and vitamin D supplements).
3. Treatment is aimed at reducing the occurrence of fractures by maintaining or increasing bone strength.
4. Medications that decrease bone resorption (antiresorptive) and medications that promote bone formation are used (Box 62.3).
5. Antiresorptive medications include raloxifene, calcitonin, and bisphosphonates.
6. Teriparatide promotes bone growth.

B. Interventions

1. Abaloparatide
   a. Regulates calcium and phosphate metabolism in bone and kidney by binding to parathyroid hormone receptors and stimulates osteoblastic activity
   b. Contraindicated in clients with existing hypercalcemia or hyperparathyroidism
   c. Assess the client's mineral bone density before and during treatment
   d. Monitor for signs and symptoms of orthostatic hypotension following dose administration; usually occurs within 4 hours of injection.
2. Calcitonin-salmon
   a. Calcitonin is secreted by the thyroid gland and inhibits osteoclastic bone resorption.
   b. Instruct the client on how to administer the intranasal or subcutaneous form, depending on the route prescribed.
   c. Intranasal route: Examine the nares for irritation; alternate nostrils for doses.
   d. When calcitonin is taken, it is important to monitor for hypocalcemia.

BOX 62.3 Medications to Prevent or Treat Osteoporosis

- Abaloparatide
- Alendronate
- Calcitonin-salmon
- Calcium and vitamin D
- Denosumab
- Ibandronate
- Pamidronate
- Raloxifene
- Risedronate
- Romosozumab
- Teriparatide
- Zoledronic acid

3. Bisphosphonates
   a. Bisphosphonates inhibit osteoclast-mediated bone resorption, thereby increasing total bone mass.
   b. Bisphosphonates include alendronate, risedronate, ibandronate, pamidronate, and zoledronic acid.
   c. Contraindicated for clients with esophageal disorders that can impede swallowing and for clients who cannot sit or stand for at least 30 minutes (60 minutes with ibandronate)
   d. Adverse effects include esophagitis, muscle pain, and ocular problems; the client is instructed to contact the PHCP if adverse effects occur.

! Because of the risk of esophagitis, bisphosphonates must be administered in the morning before eating or drinking with a full glass of water; the client must then remain sitting or standing and postpone ingesting anything for at least 30 minutes (60 minutes with ibandronate).

4. Raloxifene
   a. Antiresorptive medication (nonbisphosphonate)
   b. Contraindicated in clients who have a history of venous thrombotic events
   c. Needs to be discontinued 72 hours prior to prolonged immobilization periods (such as with periods of extended bed rest)
   d. Instruct the client to avoid extended periods of restricted activity (such as when traveling).
5. Denosumab: A monoclonal antibody that treats osteoporosis and hypercalcemia; can also treat bone cancer and bone problems in those who have cancer.
6. Romosozumab
   a. Romosozumab is used for the treatment of postmenopausal osteoporosis.
   b. Has been associated with risk of myocardial infarction and stroke, hypersensitivity, arthralgia, headache, injection site reaction, and paresthesia

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. Teriparatide
   a. Teriparatide stimulates new bone formation, thus increasing bone mass.
   b. Teriparatide is a portion of the human parathyroid hormone and works by increasing the action of osteoblasts.
   c. Is usually reserved for clients at high risk for fractures
   d. Has been associated with the development of bone cancer

V. Medications to Treat Musculoskeletal Pain

A. Nonsteroidal antiinflammatory drugs (NSAIDs) such as ibuprofen, naproxen, aspirin, diclofenac, meloxicam, indomethacin, and celecoxib are common first-line medications.
B. Acetaminophen is another first-line treatment for musculoskeletal pain.
C. Other medications such as skeletal muscle relaxants, antidepressant medications, and opioid analgesics may also be prescribed. See Chapters 60 and 69 for more information.

NSAIDs are commonly used to treat musculoskeletal pain. Acetaminophen may also be used to treat this type of pain. Both are often considered first-line treatments.

PRACTICE QUESTIONS

1. A client has been on treatment for rheumatoid arthritis for 3 weeks. During the administration of etanercept, which is **most important** for the nurse to assess?
   1. The injection site for itching and edema
   2. The white blood cell counts and platelet counts
   3. Whether the client is experiencing fatigue and joint pain
   4. Whether the client is experiencing a metallic taste in the mouth and a loss of appetite

2. Allopurinol is prescribed for a client and the nurse provides medication instructions to the client. Which instruction would the nurse provide?
   1. Drink 3000 mL of fluid a day.
   2. Take the medication on an empty stomach.
   3. The effect of the medication will occur immediately.
   4. Any swelling of the lips is a normal expected response.

3. Colchicine is prescribed for a client with a diagnosis of gout. The nurse reviews the client's record, knowing that this medication would be used with caution in which disorder?
   1. Myxedema
   2. Kidney disease
   3. Hypothyroidism
   4. Diabetes mellitus

4. Alendronate is prescribed for a client with osteoporosis, and the nurse is providing instructions on administration of the medication. Which instruction would the nurse provide?
   1. Take the medication at bedtime.
   2. Take the medication in the morning with breakfast.
   3. Lie down for 30 minutes after taking the medication.
   4. Take the medication with a full glass of water after rising in the morning.

5. The nurse is preparing discharge instructions for a client who sustained a skeletal muscle injury and is receiving baclofen. Which instruction would be included in the teaching plan?
   1. Restrict fluid intake.
   2. Avoid the use of alcohol.
   3. Stop the medication if diarrhea occurs.
   4. Notify the primary health care provider (PHCP) if fatigue occurs.

6. The nurse is analyzing the laboratory studies on a client receiving dantrolene to treat muscle spasms from an injury. Which laboratory test would identify an adverse effect associated with the administration of this medication?
   1. Platelet count
   2. Creatinine level
   3. Liver function tests
   4. Blood urea nitrogen level

7. Cyclobenzaprine is prescribed for a client for muscle spasms, and the nurse is reviewing the client's record. Which disorder, if noted in the record, would indicate a need to contact the primary health care provider about the administration of this medication?
   1. Glaucoma
   2. Emphysema
   3. Hypothyroidism
   4. Diabetes mellitus

8. In monitoring a client's response to disease-modifying antirheumatic drugs (DMARDs), which assessment findings would the nurse consider acceptable responses? **Select all that apply.**
   ❑ 1. Control of symptoms during periods of emotional stress

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

❑ **2.** Normal white blood cell, platelet, and neutrophil counts
❑ **3.** Radiological findings that show no progression of joint degeneration
❑ **4.** An increased range of motion in the affected joints 3 months into therapy
❑ **5.** Inflammation and irritation at the injection site 3 days after the injection is given
❑ **6.** A low-grade temperature on rising in the morning that remains throughout the day

9. The nurse is administering an intravenous dose of methocarbamol to a client with a musculoskeletal injury. For which adverse effect would the nurse monitor?
1. Tachycardia
2. Rapid pulse
3. Bradycardia
4. Hypertension

ANSWERS

1. *Answer:* 2
Rationale: Infection and pancytopenia are adverse effects of etanercept. Laboratory studies are performed prior to and during medication treatment. The appearance of abnormal white blood cell counts and abnormal platelet counts can alert the nurse to a potentially life-threatening infection. Injection site itching is a common occurrence following administration. A metallic taste and loss of appetite are not common signs of adverse effects of this medication.
Test-Taking Strategy: Note the **strategic words**, *most important*. Option 4 can be eliminated because this is not a common adverse effect. In early treatment, residual fatigue and joint pain may still be apparent. As for the remaining options, the correct option monitors for a hematological disorder, which could indicate a reason for discontinuing this medication and needs to be reported.
Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. pp. 514-515.

2. *Answer:* 1
Rationale: Clients taking allopurinol are encouraged to drink 3000 mL of fluid a day, unless otherwise contraindicated. A full therapeutic effect may take 1 week or longer. Allopurinol is to be given with, or immediately after, meals or milk. A client who develops a rash, irritation of the eyes, or swelling of the lips or mouth needs to contact the primary health care provider because this may indicate hypersensitivity.
Test-Taking Strategy: Focus on the **subject,** client instructions for allopurinol. Option 4 can be eliminated easily because it indicates hypersensitivity, which is not a normal expected response. From the remaining options, recalling that this medication is used to treat gout and recalling the pathophysiology of this disorder will direct you to the correct option.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. p. 690.

3. *Answer:* 2
Rationale: Colchicine is used with caution in older clients, debilitated clients, and clients with cardiac, kidney, or gastrointestinal disease. The disorders in options 1, 3, and 4 are not concerns with administration of this medication.
Test-Taking Strategy: Focus on the **subject**, the cautions associated with colchicine. Note that options 1, 3, and 4 are **comparable or alike** and are endocrine-related disorders. The correct option is different from the others.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. pp. 686-687.

4. *Answer:* 4
Rationale: Precautions need to be taken with the administration of alendronate to prevent gastrointestinal adverse effects (especially esophageal irritation) and to increase absorption of the medication. The medication needs to be taken with a full glass of water after rising in the morning. The client is not to eat or drink anything for 30 minutes following administration and should not lie down after taking the medication.
Test-Taking Strategy: Focus on the **subject,** the administration of alendronate. Recalling that this medication can cause esophageal irritation will direct you to the correct option.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. p. 533.

5. *Answer:* 2
Rationale: Baclofen is a skeletal muscle relaxant. The client needs to be cautioned against the use of alcohol and other central nervous system depressants, because baclofen potentiates the depressant activity of these agents. Constipation, rather than diarrhea, is a side effect. Restriction of fluids is not necessary, but the client needs to be warned that urinary retention can occur. Fatigue is related to a central nervous system effect that is most intense during the early phase of therapy and diminishes with continued medication use. The client does not need to notify the PHCP about fatigue.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Test-Taking Strategy: Focus on the **subject,** teaching points for baclofen. Recalling that baclofen is a skeletal muscle relaxant will direct you easily to the correct option. If you were unsure of the correct option, use general principles related to medication administration. Alcohol should be avoided with the use of medications.
Reference: Kizior, R., & Hodgson, B. (2022). *Saunders nursing drug handbook 2022*. St. Louis: Elsevier. p. 107-108.

6. *Answer:* 3
Rationale: Dose-related liver damage is the most serious adverse effect of dantrolene. To reduce the risk of liver damage, liver function tests should be performed before treatment and throughout the treatment interval. Dantrolene is administered at the lowest effective dosage for the shortest time necessary.
Test-Taking Strategy: Eliminate options 2 and 4 because these tests assess kidney function and are **comparable or alike.** From the remaining options, you must recall that this medication affects liver function.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. p. 191.

7. *Answer:* 1
Rationale: Because cyclobenzaprine has anticholinergic effects, it should be used with caution in clients with a history of urinary retention, glaucoma, and increased intraocular pressure. Cyclobenzaprine should be used only for a short time (2 to 3 weeks). The conditions in options 2, 3, and 4 are not a concern with this medication.
Test-Taking Strategy: Focus on the **subject,** a contraindication to cyclobenzaprine. Recalling that this medication has anticholinergic effects will direct you to the correct option.
Reference: Kizior, R., & Hodgson, B. (2022). *Saunders nursing drug handbook 2022*. St. Louis: Elsevier. pp. 282-283.

8. *Answer:* 1, 2, 3, 4
Rationale: Because emotional stress frequently exacerbates the symptoms of rheumatoid arthritis, the absence of symptoms is a positive finding. DMARDs are given to slow the progression of joint degeneration. In addition, an improvement in the range of motion after 3 months of therapy with normal blood work is a positive finding. Temperature elevation and inflammation and irritation at the medication injection site could indicate signs of infection.
Test-Taking Strategy: Focus on the **subject,** acceptable responses to therapy. Recalling that signs of an infection can indicate an unexpected and unwanted finding will assist in eliminating options 5 and 6.
Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 1021, 1024.

9. *Answer:* 3
Rationale: Intravenous administration of methocarbamol can cause hypotension and bradycardia. The nurse needs to monitor for these adverse effects. Options 1, 2, and 4 are not effects with administration of this medication.
Test-Taking Strategy: Eliminate options 1 and 2 first because they are **comparable or alike.** Knowledge about the specific adverse effects related to the intravenous use of this medication will direct you to the correct option. Remember that hypotension and bradycardia can occur with intravenous administration of methocarbamol.
Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed.). St. Louis: Elsevier. p. 252.

UNIT XVII

Immune Problems of the Adult Client

Pyramid to Success

Pyramid Points focus on the effects of and complications associated with an immune deficiency. Specific areas relate to risk for infection, the nursing care related to the problem, the impact of the treatment or problem, and client adaptation. Human immunodeficiency virus and acquired immunodeficiency syndrome is an emphasis, along with protecting the client from infection and preventing the transmission of infection to other individuals. Psychosocial issues related to social isolation and the body image disturbances that can occur as a result of the immune disorder are discussed.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

Acting as an advocate related to the client's decisions
Addressing advance directives
Consulting with the interprofessional health care team
Ensuring that informed consent for treatments and procedures has been obtained
Handling hazardous and infectious materials safely
Implementing standard and other precautions
Maintaining asepsis
Maintaining confidentiality regarding diagnosis
Preventing infection
Prioritizing hypotheses based on client needs
Upholding client rights

Health Promotion and Maintenance

Ensuring that the client receives recommended immunizations
Generating solutions for self-care at home
Implementing health screening measures
Performing physical assessment techniques related to the immune system
Preventing disease related to infection
Providing health promotion programs
Respecting client lifestyle choices

Psychosocial Integrity

Assisting in mobilizing appropriate support and resource systems
Assisting the client and family to cope
Assisting the client and family to adapt and problem-solve during illness or stressful events
Considering religious, spiritual, and cultural preferences
Discussing grief and loss related to death and the dying process
Monitoring for expected body image changes
Promoting a positive environment to maintain optimal quality of life

Physiological Integrity

Analyzing assessment findings to determine the client's health status
Evaluating for the expected and unexpected responses to treatments
Managing pain
Optimizing pharmacological treatment
Promoting nutrition
Protecting the client from infection
Providing basic care and comfort
Recognizing cues that indicate a complication
Reviewing diagnostic test and laboratory test results
Taking action in medical emergencies

CHAPTER 63

Immune Problems

Contributor: Jessica Grimm, DNP, APRN, ACNP-BC, CNE

PRIORITY CONCEPTS Immunity; Infection

I. Functions of the Immune System (Fig. 63.1)

A. Provides protection against invasion by microorganisms from outside the body

B. Protects the body from internal threats and maintains the internal environment by removing dead or damaged cells

II. Immune Response

A. T lymphocytes and B lymphocytes

1. Lymphocytes are produced in the bone marrow and migrate to lymphoid tissue, where they remain dormant until they need to form sensitized lymphocytes for cellular immunity or antibodies for humoral immunity.
2. Some B lymphocytes lie dormant until a specific antigen enters the body, at which time they greatly increase in number and are available for defense.
3. Types of T lymphocytes include helper/inducer, suppressor, and cytotoxic/cytolytic.
4. T and B lymphocytes are necessary for a normal immune response.

B. Humoral response

1. Humoral response is immediate.
2. This type of response provides protection against acute, rapidly developing bacterial and viral infections.

C. Cellular response

1. Cellular response is delayed; this is also called *delayed hypersensitivity.*
2. This type of response is active against slowly developing bacterial infections and is involved in autoimmune responses, some allergic reactions, and rejection of foreign cells.

III. Immunity

A. Innate immunity

1. Innate immunity is also called *native* or *natural immunity.*
2. It is present at birth and includes biochemical, physical, and mechanical barriers of defense, as well as the inflammatory response.

B. Acquired immunity

1. Acquired or adaptive immunity is received passively from the birthing parent's antibodies, animal serum, or antibodies produced in response to a disease.
2. Immunization produces active acquired immunity.

IV. Immunizations: See Chapter 19 and the Centers for Disease Control and Prevention website (https://www.cdc.gov/vaccines/schedules/index.html) for information about immunizations.

V. Laboratory Studies

A. Antinuclear antibody (ANA) determination

1. The ANA determination is a blood test used for the differential diagnosis of rheumatic diseases and for the detection of antinucleoprotein factors and patterns associated with certain autoimmune diseases.
2. The test is negative at a 1:40 dilution, depending on the laboratory.
3. A positive result does not necessarily confirm a disease.
4. The ANA is positive in most individuals diagnosed with systemic lupus erythematosus (SLE); it may also be positive in individuals with systemic sclerosis (scleroderma) or rheumatoid arthritis.
5. An ANA result can be false positive in some individuals.

B. Anti-dsDNA antibody test

1. The anti-dsDNA (double-stranded DNA) antibody test is a blood test done specifically to identify or differentiate DNA antibodies found in SLE.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

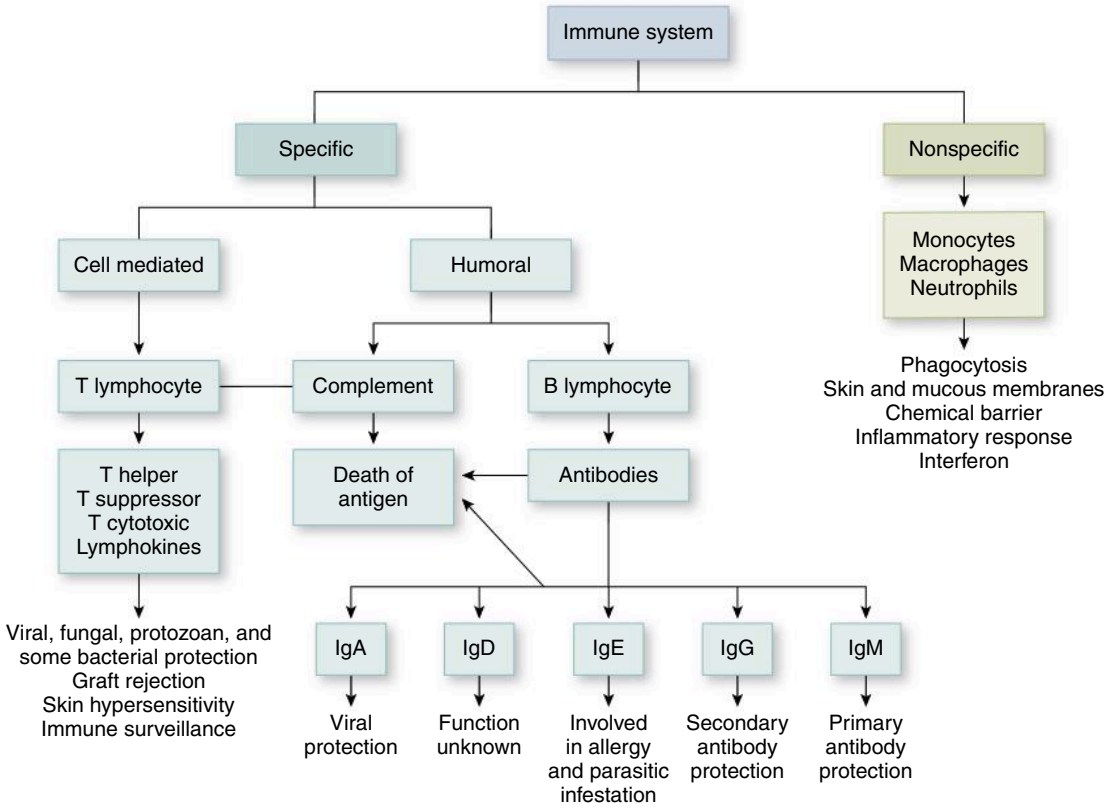

FIG. 63.1 Components of the immune system. *Ig*, Immunoglobulin.

2. The test supports a diagnosis, monitors disease activity and response to therapy, and establishes a prognosis for SLE.
3. Values: negative, lower than 70 U/mL by enzyme-linked immunosorbent assay (ELISA)

C. Human immunodeficiency virus (HIV) testing: Client privacy needs to be maintained due to the sensitive nature of this test; a positive (reactive) test result indicates the need for additional testing.

1. $CD4^+$ T-cell count
   - **a.** Monitors the progression of HIV
   - **b.** As the disease progresses, usually the number of $CD4^+$ T cells decreases, with a resultant decrease in immunity.
   - **c.** The normal $CD4^+$ T-cell count is between 500 and 1600 cells/L.
   - **d.** In general, the immune system remains healthy with $CD4^+$ T-cell counts higher than 500 cells/L.
   - **e.** Immune system problems occur when the $CD4^+$ T-cell count is between 200 and 499 cells/L.
   - **f.** Severe immune system problems occur when the $CD4^+$ T-cell count is lower than 200 cells/L.
2. CD4-to-CD8 ratio
   - **a.** Monitors progression of HIV
   - **b.** Normal ratio is approximately 2:1.
3. Viral culture involves placing the infected client's blood cells in a culture medium and measuring the amount of reverse transcriptase activity over a specified period of time.
4. Viral load testing measures the presence of HIV viral genetic material (RNA) or another viral protein in the client's blood.
5. The p24 antigen assay quantifies the amount of HIV viral core protein in the client's serum.
6. Oral testing for HIV
   - **a.** Uses a device that is placed against the gum and cheek for 2 minutes
   - **b.** Oral transmucosal exudate (not saliva) is drawn into an absorbable pad, which, in an HIV-positive individual, contains antibodies.
   - **c.** The pad is placed in a solution, and a specified observable change is noted if the test result is positive.
   - **d.** If the result is positive, a blood test is needed to confirm the results.
7. Home test kits for HIV
   - **a.** In one at-home test kit, a drop of blood or oral transmucosal exudate is placed on a test card with a special code number; the card is mailed to a laboratory for testing for HIV antibodies.
   - **b.** The individual receives the results by calling a special telephone number and entering the special code number; test results are then given.

Negative
Positive
Positive
Wheal is less than 0.5 cm in diameter
Wheal is 0.5 cm in diameter (1+)
Wheal is 1.0 cm in diameter (2+)
Positive
Positive
Wheal is 1.5 cm in diameter (3+)
Wheal is 2.0 cm in diameter (4+)

FIG. 63.2 Interpretation of intradermal test results, based on the size of the wheal after 15 to 30 minutes.

8. Nursing considerations
   - **a.** Maintain issues of confidentiality surrounding HIV and acquired immunodeficiency syndrome (AIDS) testing.
   - **b.** Follow prescribed state regulations and protocols related to reporting positive test results.
   - **c.** Internet and mobile devices have increased accessibility to resources needed for managing HIV.

D. Skin testing
1. Description
   - **a.** The administration of an allergen to the surface of the skin or into the dermis
   - **b.** Administered by patch, scratch, or intradermal techniques
2. Preprocedure interventions
   - **a.** Discontinue systemic corticosteroids or antihistamine therapy 5 days before the test as prescribed.
   - **b.** Ensure that informed consent was obtained.
3. Postprocedure interventions
   - **a.** Record the site, date, and time of the test.
   - **b.** Record the date and time for follow-up site reading.
   - **c.** Have the client remain in the waiting room or office for at least 30 minutes after the injections to monitor for adverse effects.
   - **d.** Evaluate the risk for anaphylaxis, and be sure a licensed provider is available to assist; medications and equipment to manage anaphylaxis are required.
   - **e.** Avoid the spreading of allergen solutions during the test.
   - **f.** Inspect the site for erythema, papules, vesicles, edema, and wheal (Fig. 63.2).
   - **g.** Measure flare along with the wheal, and document the size and other findings.
   - **h.** Provide the client with a list of potential allergens, if identified.

⚠ Have resuscitation equipment available if skin testing is performed, because the allergen may induce an anaphylactic reaction.

VI. Hypersensitivity and Allergy

A. Description
1. An abnormal, individual response to certain substances that normally do not trigger such an exaggerated reaction
2. In some types of allergies, a reaction occurs on a second and subsequent contact with the allergen.
3. Skin testing may be done to determine the allergen.

B. Assessment
1. History of exposure to allergens
2. Social and environmental factors, including the physical environment
3. Client's lifestyle and stress level
4. Nutrition
5. Itching, tearing, and burning of eyes and skin
6. Rashes
7. Nose twitching, nasal stuffiness

C. Interventions
1. Identification of the specific allergen using a daily or weekly diary
2. Management of the symptoms with antihistamines, antiinflammatory agents, and/or corticosteroids
3. Ointments, creams, wet compresses, and soothing baths for local reactions
4. Desensitization programs may be recommended.

VII. Anaphylaxis

A. Description
1. A serious and immediate hypersensitivity reaction that releases histamine from the damaged cells
2. Anaphylaxis can be systemic or cutaneous (localized).

Telegram & Insta: NCLEX_RN_Edu

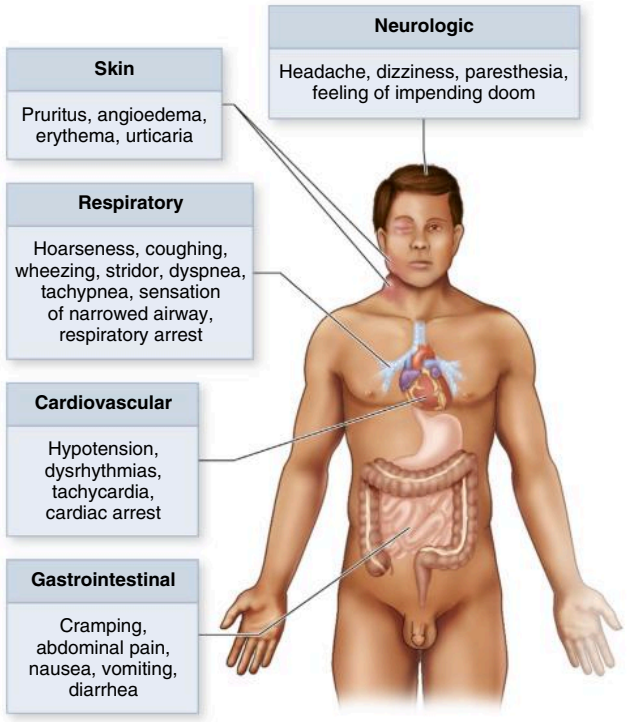

FIG. 63.3 Clinical manifestations of a systemic anaphylactic reaction.

BOX 63.1 Products That May Contain Natural Rubber Latex

- ACE bandages (brown)
- Adhesive or elastic bandages
- Ambu bag
- Balloons
- Blood pressure cuff (tubing and bladder)
- Catheter leg bag straps
- Catheters
- Condoms
- Diaphragms
- Elastic pressure stockings
- Electrocardiographic pads
- Feminine hygiene pads
- Gloves
- Intravenous catheters, tubing, and rubber injection ports
- Nasogastric tubes
- Pads for crutches
- Prepackaged enema kits
- Rubber stoppers on medication vials
- Stethoscopes
- Syringes

NOTE: Health care agencies use as many nonlatex products as possible and have nonlatex supplies available for clients with a latex allergy.

B. Assessment (Fig. 63.3)

C. Interventions (see Chapter 70 for additional information on anaphylaxis)

1. Quickly assess respiratory status and maintain a patent airway.
2. Stay with the client.
3. Call the primary health care provider (PHCP) and Rapid Response Team.
4. Immediately discontinue the IV medication or infusing solution if it is suspected that the client is having an anaphylactic reaction to the medication or solution.
5. Start an intravenous (IV) line and infuse normal saline if the client does not already have an IV line.
6. Administer oxygen.
7. Check vital signs. If the blood pressure is normal, elevate the head of the bed to 45 degrees or higher to improve ventilation.
8. Ensure that intubation and tracheotomy equipment is ready.
9. Prepare to administer diphenhydramine and epinephrine.
10. Document the event, actions taken, and the client's response.

VIII. Latex Allergy

A. Description

1. Latex allergy is a hypersensitivity to latex.
2. The source of the allergic reaction is thought to be the proteins in the natural rubber latex or the various chemicals used in the manufacturing process of latex gloves.
3. Symptoms of the allergy can range from mild contact dermatitis to moderately severe symptoms of rhinitis, conjunctivitis, urticaria, and bronchospasm to severe life-threatening anaphylaxis.

B. Common routes of exposure (Box 63.1)

1. Cutaneous: Natural latex gloves and latex balloons
2. Percutaneous and parenteral: Intravenous lines and catheters; hemodialysis equipment
3. Mucosal: Use of latex condoms, catheters, airways, and nipples
4. Aerosol: Aerosolization of powder from latex gloves can occur when gloves are dispensed from the box or when gloves are removed from the hands.

C. At-risk individuals

1. Health care workers
2. Individuals who work in the rubber industry
3. Individuals having multiple surgeries
4. Individuals with spina bifida
5. Individuals who wear gloves frequently, such as food handlers, hairdressers, and auto mechanics
6. Individuals allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, and water chestnuts; most people with latex allergy have a positive allergy test to at least one related food.

Telegram & Insta: NCLEX_RN_Edu

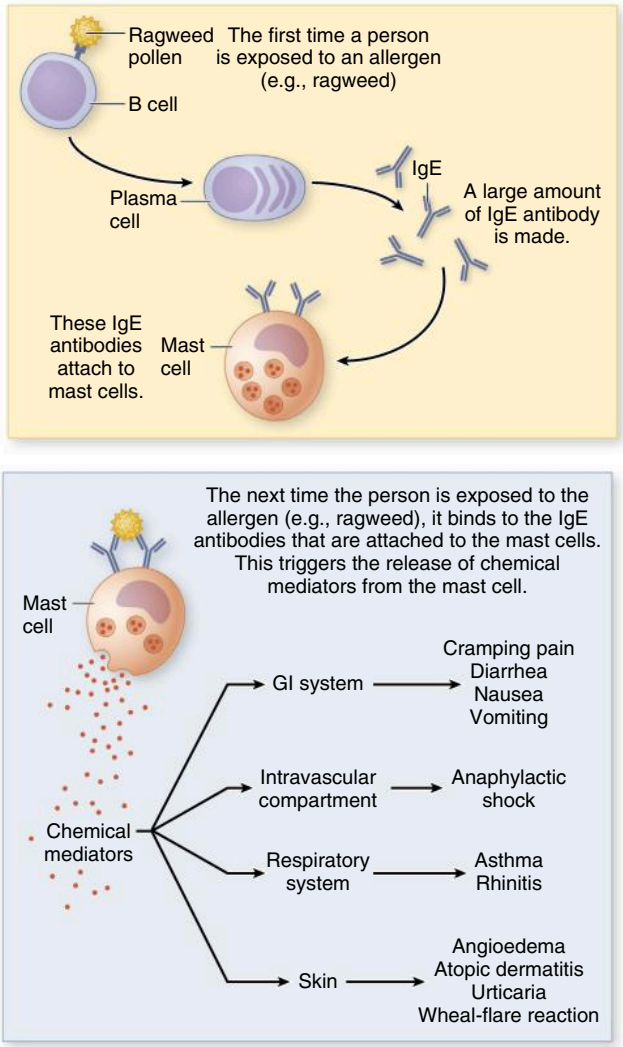

FIG. 63.4 Steps in a type 1 allergic reaction. *GI*, Gastrointestinal; *IgE*, immunoglobulin E.

D. Assessment
1. Anaphylaxis or type 1 hypersensitivity is a response to natural rubber latex (Fig. 63.4; also see Fig. 63.3).
2. A delayed type 4 hypersensitivity reaction can occur; symptoms of contact dermatitis include pruritus, edema, erythema, vesicles, papules, and crusting and thickening of the skin and can occur within 6 to 48 hours following exposure.

E. Interventions (Box 63.2)

IX. Immunodeficiency

A. Description
1. **Immunodeficiency** is the absence or inadequate production of immune bodies.
2. The disorder can be congenital (primary) or acquired (secondary).
3. Treatment depends on the inadequacy of immune bodies and its primary cause.

BOX 63.2 Interventions for the Client with a Latex Allergy

- Ask the client about a known allergy to latex when performing the initial assessment.
- Identify risk factors for a latex allergy in the client.
- Use nonlatex gloves and all latex-safe supplies.
- Keep a latex-safe supply cart near the client's room.
- Apply a cloth barrier to the client's arm under a blood pressure cuff.
- Use latex-free syringes and medication containers (glass ampules) and latex-safe intravenous equipment.
- Instruct the client to wear a MedicAlert bracelet.
- Instruct the client about the importance of informing health care providers and local and paramedic ambulance companies about the allergy.
- Carry an epinephrine pen for possible anaphylaxis.

B. Assessment
1. Factors that decrease immune function
2. Frequent infections
3. Nutritional status
4. Medication history, such as chemotherapy or the use of corticosteroids for long periods
5. History of alcohol or drug abuse
6. Stress and trauma

C. Interventions
1. Protect the client from infection.
2. Promote a balanced diet with adequate nutrition.
3. Use strict aseptic technique for all procedures.
4. Provide psychosocial care regarding lifestyle changes and role changes.
5. Instruct the client in measures to prevent infection.
6. Instruct the client to wear a MedicAlert bracelet.

The priority concern for a client with immunodeficiency is infection.

X. Autoimmune Disease

A. Description
1. Body is unable to recognize its own cells as a part of itself.
2. Autoimmune disease can affect collagenous tissue.

B. Systemic lupus erythematosus (SLE)
1. Description
   - **a.** Chronic, progressive, systemic inflammatory disease that can cause major organs and systems to fail
   - **b.** Connective tissue and fibrin deposits collect in blood vessels on collagen fibers and on organs.
   - **c.** The deposits lead to necrosis and inflammation in blood vessels, lymph nodes, gastrointestinal tract, and pleura.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

d. No cure for the disease is known, but remissions are frequently experienced by clients who manage their care well.

2. Causes
- **a.** The cause of SLE is unknown, but it is believed to be a defect in immunological mechanisms, with a genetic origin.
- **b.** Precipitating factors include medications, stress, genetic factors, sunlight or ultraviolet light, and pregnancy.
- **c.** Discoid lupus erythematosus is possible with some medications but totally disappears after the medication is stopped; the only manifestation is the skin rash that occurs in lupus.

3. Assessment
- **a.** Assess for precipitating factors.
- **b.** Erythema of the face (malar rash; also called a butterfly rash)
- **c.** Dry, scaly, raised discoid rash on the face or upper body; scarring in older lesions; painless oral ulcers
- **d.** Fever
- **e.** Weakness, malaise, and fatigue
- **f.** Anorexia
- **g.** Weight loss
- **h.** Photosensitivity
- **i.** Joint pain
- **j.** Erythema of the palms
- **k.** Anemia
- **l.** Positive antinuclear antibody (ANA) test and lupus erythematosus preparation
- **m.** Elevated erythrocyte sedimentation rate (ESR) and C-reactive protein level

4. Interventions
- **a.** Monitor skin integrity and provide frequent oral care.
- **b.** Instruct the client to clean the skin with a mild soap, avoiding harsh and perfumed substances.
- **c.** Assist with the use of ointments and creams for the rash as prescribed.
- **d.** Identify factors contributing to fatigue.
- **e.** Administer iron, folic acid, or vitamin supplements as prescribed if anemia occurs.
- **f.** Provide a high-vitamin and high-iron diet.
- **g.** Provide a high-protein diet if there is no evidence of kidney disease.
- **h.** Instruct in measures to conserve energy, such as pacing activities and balancing rest with exercise.
- **i.** Administer topical or systemic corticosteroids, salicylates, and nonsteroidal antiinflammatory drugs as prescribed for pain and inflammation.
- **j.** Administer medications to decrease the inflammatory response as prescribed.
- **k.** Hydroxychloroquine may be prescribed.
- **l.** Monitor intake, output, and daily weight for signs of fluid overload if corticosteroids are used.
- **m.** Instruct the client to avoid exposure to sunlight and ultraviolet light.
- **n.** Monitor for proteinuria and red cell casts in the urine.
- **o.** Monitor for bruising, bleeding, and injury.
- **p.** Assist with plasmapheresis as prescribed to remove autoantibodies and immune complexes from the blood before organ damage occurs.
- **q.** Monitor for signs of organ involvement such as pleuritis, nephritis, pericarditis, coronary artery disease, hypertension, neuritis, anemia, and peritonitis.
- **r.** Note that lupus nephritis occurs early in the disease process.
- **s.** Provide supportive therapy as major organs become affected.
- **t.** Provide emotional support, and encourage the client to verbalize feelings.
- **u.** Provide information regarding support groups, and encourage the use of community resources.
- **v.** Lifestyle changes are needed for management and prevention of frequent flares.

For the client with SLE, monitor the blood urea nitrogen and creatinine levels frequently for signs of renal impairment.

C. Scleroderma (systemic sclerosis)

1. Description
- **a.** Scleroderma is a chronic connective tissue disease similar to SLE. It is characterized by inflammation, fibrosis, and sclerosis.
- **b.** This disorder affects the connective tissue throughout the body.
- **c.** It causes fibrotic changes involving the skin, synovial membranes, esophagus, heart, lungs, kidneys, and gastrointestinal tract.
- **d.** Treatment is directed toward forcing the disease into remission and slowing its progress.

2. Assessment
- **a.** Pain
- **b.** Stiffness and muscle weakness
- **c.** Pitting edema of the hands and fingers that progresses to the rest of the body
- **d.** Taut and shiny skin that is free from wrinkles
- **e.** Skin tissue is tight, hard, and thick; loses its elasticity; and adheres to underlying structures.
- **f.** Dysphagia
- **g.** Decreased range of motion
- **h.** Joint contractures
- **i.** Inability to perform activities of daily living

Telegram & Insta: NCLEX_RN_Edu

3. Interventions
   a. Encourage activity as tolerated.
   b. Maintain a constant room temperature.
   c. Provide small, frequent meals, eliminating foods that stimulate gastric secretions, such as spicy foods, caffeine, and alcohol.
   d. Monitor for esophageal involvement; if present, advise the client to sit up for 1 to 2 hours after meals. Using additional pillows and raising the head of the bed on blocks may help reduce nocturnal reflux.
   e. Provide supportive therapy as the major organs become affected.
   f. Administer corticosteroids as prescribed for inflammation.
   g. Provide emotional and psychological support, and encourage the use of resources as necessary.
   h. Emphasize daily oral hygiene to avoid increased tooth and gum problems. The client needs a dentist who is familiar with scleroderma and able to adapt care to a small mouth.
   i. Avoid finger-stick blood testing because of poor healing and impaired circulation.
   j. Encourage the use of moist heat applications or paraffin baths to promote skin flexibility in the hands and feet.
   k. Avoid exposing the hands and feet to extreme temperatures.
   l. Avoid smoking because of its vasoconstricting effect.
   m. Encourage alcohol-free lotions to improve skin dryness and cracking.

D. Polyarteritis nodosa
   1. Description
      a. Polyarteritis nodosa is a collagen disease; it is a form of systemic vasculitis that causes inflammation of the arteries in visceral organs, brain, and skin.
      b. Treatment is similar to the treatment for SLE.
      c. Polyarteritis nodosa affects middle-aged persons.
      d. The cause is unknown and the prognosis is poor.
      e. Renal disorders and cardiac involvement are the most frequent causes of death, although any organ can be affected.
   2. Assessment
      a. Malaise and weakness
      b. Low-grade fever
      c. Severe abdominal pain
      d. Bloody diarrhea
      e. Weight loss
      f. Elevated ESR
   3. Interventions: Refer to interventions for SLE.

E. Pemphigus
   1. Description
      a. Pemphigus is a rare autoimmune disease that occurs predominantly between middle age and old age.
      b. The cause is unknown, and the disorder is potentially fatal.
      c. Treatment is aimed at suppressing the immune response and blister formation.
   2. Assessment
      a. Fragile, partial-thickness lesions bleed, weep, and form crusts when bullae are disrupted.
      b. Debilitation, malaise, pain, and dysphagia
      c. Nikolsky's sign: Separation of the epidermis caused by rubbing the skin
      d. Leukocytosis, eosinophilia, foul-smelling discharge from skin
   3. Interventions
      a. Provide supportive care.
      b. Provide oral hygiene and increase fluid intake.
      c. Soothe oral lesions.
      d. Assist with soothing baths, as prescribed for relief of symptoms.
      e. Administer topical or systemic antibiotics as prescribed for secondary infections.
      f. Administer corticosteroids and cytotoxic agents as prescribed to bring about remission.

XI. Goodpasture's Syndrome

A. Description
   1. A rare autoimmune disorder; autoantibodies are made against the glomerular basement membrane and alveolar basement membrane.
   2. It is most common in young adults who smoke; the exact cause is unknown.
   3. The lungs and the kidneys are affected primarily, and the disorder usually is not diagnosed until significant pulmonary or renal involvement occurs.

B. Assessment
   1. Clinical manifestations indicating pulmonary and renal involvement
   2. Shortness of breath
   3. Hemoptysis
   4. Decreased urine output
   5. Edema and weight gain
   6. Hypertension and tachycardia
   7. Hematuria
   8. Weakness
   9. Anemia

C. Interventions
   1. Focus on suppressing the autoimmune response with medications such as corticosteroids and on plasmapheresis (filtration of the plasma to remove some proteins and autoantibodies).

Telegram & Insta: NCLEX_RN_Edu

BOX 63.3 Assessment and Stages of Lyme Disease

First Stage

- Symptoms can occur several days to months following the bite.
- A small red pimple develops that may spread into a ring-shaped rash; it may occur anywhere on the body.
- Ring-shaped rash may be large or small, or may not occur at all.
- Flulike symptoms occur, such as headaches, stiff neck, muscle aches, and fatigue.

Second Stage

- This stage occurs several weeks following the bite.
- Joint pain occurs.
- Neurological complications occur, such as meningitis, facial paralysis, and peripheral neuritis.
- Cardiac complications occur, such as dysrhythmias, dyspnea, dizziness, or palpitations.

Third Stage

- Large joints become involved.
- Arthritis progresses.

2. Administer azathioprine as prescribed.
3. Provide supportive therapy for pulmonary and renal involvement.
4. Avoid smoking and encourage smoking cessation.

XII. Lyme Disease

A. Description

1. An infection caused by the spirochete *Borrelia burgdorferi,* acquired from a tick bite (ticks live in wooded areas and survive by attaching to a host)
2. Infection with the spirochete stimulates inflammatory cytokines and autoimmune mechanisms.

B. Assessment (Box 63.3; Fig. 63.5)

1. The typical ring-shaped rash of Lyme disease does not occur in all clients. Many clients never develop a rash.
2. If a rash does occur, it can occur anywhere on the body, not only at the site of the bite.

C. Interventions

1. Gently remove the tick with tweezers, wash the skin with antiseptic, and dispose of the tick by flushing it down the toilet; the tick may also be placed in a sealed jar so that the primary health care provider can inspect it and determine its type.
2. Perform a blood test 4 to 6 weeks after a bite to detect the presence of the disease (testing before this time is not reliable).
3. Instruct the client in the administration of antibiotics as prescribed; these are initiated immediately (even before the blood testing results are known).

FIG. 63.5 Erythema migrans of Lyme disease.

4. Doxycycline, cefuroxime, and amoxicillin are often effective in treating early-stage infection and preventing later stages of the disease.
5. Erythromycin can be used for clients who are allergic to penicillin.
6. Prevention: see Clinical Judgment: Generate Solutions Box.

CLINICAL JUDGMENT: GENERATE SOLUTIONS

A client visits the health care clinic and tells the nurse that the family is planning a backpacking camping trip to the mountains for the weekend. The client is concerned about the possibility of exposure to ticks, getting bit by a tick, and developing Lyme disease. The nurse develops a disease prevention plan with the client and includes the following in the plan:

- Reduce exposure to ticks as much as possible because this is the best way to prevent Lyme disease.
- Spray insect repellent containing DEET sparingly on skin or clothing.
- Avoid wearing darker clothing because lighter-colored clothing makes spotting ticks easier.
- Wear long-sleeved tops and long pants, closed shoes, and a hat or cap.
- Pull socks up and over the pant legs to prevent ticks from entering under clothing.
- Apply permethrin to camping gear such as tents because it will protect from ticks for several hours.
- If possible, avoid heavily wooded areas or areas with thick underbrush.
- Walk in the center of trails.
- Bring fine-tipped tweezers if tick removal is necessary and antiseptic solution for cleaning the bite area.
- Examine clothes and the body frequently for the presence of ticks. If a tick is seen, remove it before it attaches to the skin. If it has attached, remove it with fine-tipped tweezers and clean the area with an antiseptic. Grasp the tick as close to the skin's surface as possible, and pull upward with a steady, even pressure. Avoid burning a tick from the skin because this could spread infection.
- If bringing a pet, check the pet for ticks. Have pets wear tick collars, and inspect them frequently. Avoid sleeping closely with a pet.

Telegram & Insta: NCLEX_RN_Edu

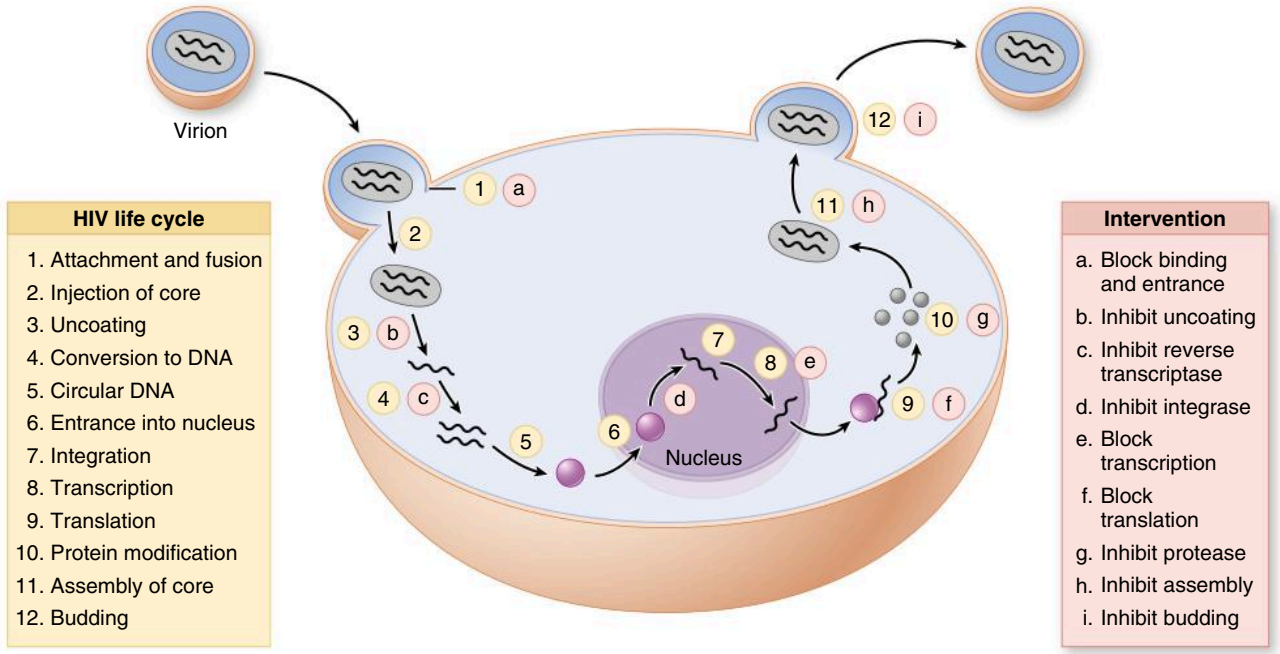

FIG. 63.6 The life cycle of human immunodeficiency virus (HIV).

XIII. Immunodeficiency Syndrome

A. Acquired immunodeficiency syndrome (AIDS)

1. AIDS is a viral disease caused by HIV, which destroys T cells, thereby increasing susceptibility to infection and malignancy (Fig. 63.6).
2. The syndrome is manifested clinically by opportunistic infections and unusual neoplasms.
3. AIDS is considered a chronic illness.
4. The disease has a long incubation period, sometimes 10 years or longer.
5. Manifestations may not appear until late in the infection.

B. Diagnosis and monitoring of the client with AIDS

1. Refer to Box 63.4 for tests used to evaluate the progression of HIV infection.
2. Refer to Box 63.5 for information used to diagnose AIDS.

C. High-risk groups

1. High risk sexual behaviors, unprotected sex
2. Heterosexual or homosexual contact with high-risk individuals
3. Intravenous drug abusers
4. Persons receiving blood products
5. Health care workers
6. Babies born to infected persons

D. Assessment

1. Malaise, fever, anorexia, weight loss, influenza-like symptoms
2. Lymphadenopathy for at least 3 months
3. Leukopenia
4. Diarrhea
5. Fatigue
6. Night sweats
7. General condition of the skin
8. Activity tolerance
9. Neurological status
10. Nutrition and food intake
11. Presence of opportunistic infections
12. Protozoan infections (*Pneumocystis jiroveci* pneumonia, a major source of mortality)
13. Neoplasms (**Kaposi's sarcoma**, manifested as purplish-red lesions of internal organs and skin; B-cell non-Hodgkin's lymphoma; cervical cancer)
14. Fungal infections (candidiasis, histoplasmosis)
15. Viral infections (cytomegalovirus, herpes simplex)
16. Bacterial infections

E. Interventions

1. Provide respiratory support.
2. Administer oxygen and respiratory treatments as prescribed.
3. Provide psychosocial support and support services as needed.
4. Maintain fluid and electrolyte balance.
5. Monitor for signs of infection, and institute protective isolation precautions as necessary.
6. Prevent the spread of infection.
7. Initiate standard and other necessary precautions.
8. Provide comfort as necessary.
9. Provide meticulous skin care.
10. Provide adequate nutritional support as prescribed.

Telegram & Insta: NCLEX_RN_Edu

BOX 63.4 Tests Used to Evaluate Progression of Human Immunodeficiency Virus (HIV) Infection

Complete Blood Cell Count
- WBC count (normal to decreased)
- Lymphopenia (<30% of the normal number of WBCs)
- Thrombocytopenia (decreased platelet count)

Lymphocyte Screen
- Reduced $CD4^+/CD8^+$ T-cell ratio
- $CD4^+$ (helper) lymphocytes decreased
- $CD8^+$ lymphocytes increased

Quantitative Immunoglobulin
- IgG level increased
- IgA level frequently increased

Chemistry Panel
- Lactate dehydrogenase level increased (all fractions)
- Serum albumin level decreased
- Total protein increased
- Cholesterol level decreased
- AST and ALT levels elevated

Anergy Panel
- Nonreactive (anergic) or poorly reactive to infectious agents or environmental materials (e.g., pokeweed, phytohemagglutinin mitogens and antigens, mumps, *Candida*)

Hepatitis B Surface Antigen Testing
- To detect the presence of hepatitis B

Blood Cultures
- To detect septicemia

Chest Radiography
- To detect *Pneumocystis jiroveci* infection or tuberculosis

Viral Load Testing
- Directly measures the actual amount of HIV viral RNA particles present in 1 mL of blood and is used to measure therapy effectiveness; the higher the viral load, the greater the risk for transmission.

ALT, Alanine aminotransferase; *AST*, aspartate aminotransferase; *Ig*, immunoglobulin; *WBC*, white blood cell.

Data from Huether, S., McCance, K., & Brasher, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. p. 192.

BOX 63.5 Diagnostic Criteria for Acquired Immunodeficiency Syndrome (AIDS)

- $CD4^+$ T-cell count drops below 200 cells/L
- Presence of a fungal, viral, protozoal, or bacterial infection
  - Candidiasis of bronchi, trachea, lungs, or esophagus
  - *Pneumocystis jiroveci* pneumonia
  - Disseminated or extrapulmonary coccidiomycosis
  - Disseminated or extrapulmonary histoplasmosis
  - Cytomegalovirus
  - Herpes simplex
  - Nocardiosis
  - Progressive multifocal leukoencephalopathy
  - Toxoplasmosis
  - *Mycobacterium tuberculosis*
  - Recurrent pneumonia
  - Recurrent *salmonella* septicemia
  - Varicella-zoster virus
- Presence of an opportunistic cancer
  - Invasive cervical cancer
  - Kaposi's sarcoma
  - Burkitt's lymphoma
  - Hodgkin's lymphoma
  - Immunoblastic lymphoma
  - Non-Hodgkin's lymphoma
  - Primary lymphoma of the brain
- Wasting syndrome (10% or more of ideal body mass)
- AIDS dementia complex

Data from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems* (11th ed.). St. Louis: Mosby. p. 219.

F. Kaposi's sarcoma

1. Description: Skin lesions that occur primarily in individuals with a compromised immune system
2. Assessment
   a. Kaposi's sarcoma is a slow-growing tumor that appears as raised, oblong, purplish, reddish-brown lesions; may be tender or nontender.
   b. Organ involvement includes the lymph nodes, airways or lungs, or any part of the gastrointestinal tract from the mouth to anus.
3. Interventions
   a. Maintain standard precautions.
   b. Provide protective isolation if the immune system is depressed.
   c. Prepare the client for radiation therapy or chemotherapy as prescribed.
   d. Administer immunotherapy, as prescribed, to stabilize the immune system.
   e. Administer analgesics and provide comfort measures; keep lesions clean and dressed to prevent infections.
   f. Administer antiviral medications as prescribed.

XIV. Posttransplantation Immunodeficiency

A. Description
1. Secondary immunodeficiency is immunosuppression caused by therapeutic agents.
2. Clients must take immunosuppressive agents for the rest of their lives posttransplantation to decrease rejection of the transplanted organ or tissue.

B. Diagnosis and monitoring of posttransplantation clients
1. Check renal and hepatic function.
2. Monitor the complete cell count with differential to determine signs of infection.
3. Assess all body secretions periodically for blood.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

C. High-risk clients
1. Clients with a history of malignancy or premalignancy have an increased susceptibility to malignancy if immunosuppressed.
2. Clients with recent infection or exposure to tuberculosis, herpes zoster, or chicken pox have a high risk for severe generalized disease when on immunosuppressive agents.

D. Assessment
1. Assess for signs of opportunistic infections.
2. Assess nutritional status.
3. Assess for signs of rejection (signs will depend on the organ or tissue transplant).

E. Interventions
1. Strict aseptic technique is necessary.
2. Provide teaching regarding asepsis and the signs of infection and rejection.
3. Institute protective isolation precautions as necessary.
4. Provide psychosocial support as needed.
5. Provide client teaching about immunosuppressants.

PRACTICE QUESTIONS

1. The nurse prepares to give a bath and change the bed linens of a client with cutaneous Kaposi's sarcoma lesions. The lesions are open and draining a scant amount of serous fluid. Which would the nurse incorporate into the plan during the bathing of this client?
1. Wearing gloves
2. Wearing a gown and gloves
3. Wearing a gown, gloves, and a mask
4. Wearing a gown and gloves to change the bed linens, and gloves only for the bath

2. The nurse provides home care instructions to a client with systemic lupus erythematosus and tells the client about methods to manage fatigue. Which statement by the client indicates a **need for further instruction**?
1. "I need to take hot baths because they are relaxing."
2. "I need to sit whenever possible to conserve my energy."
3. "I need to avoid long periods of rest because it causes joint stiffness."
4. "I need to do some exercises, such as walking, when I am not fatigued."

3. A client develops an anaphylactic reaction after receiving morphine. The nurse would take which actions? **Select all that apply.**
- ❑ 1. Administer oxygen.
- ❑ 2. Quickly assess the client's respiratory status.
- ❑ 3. Document the event, interventions, and client's response.
- ❑ 4. Leave the client briefly to contact a primary health care provider (PHCP).
- ❑ 5. Keep the client supine regardless of the blood pressure readings.
- ❑ 6. Start an intravenous (IV) infusion of D5W and administer a 500-mL bolus.

4. The nurse is conducting a teaching session with a client on their diagnosis of pemphigus. Which statement by the client indicates that the client understands the diagnosis?
1. "My skin will have tiny red vesicles."
2. "The presence of the skin vesicles is caused by a virus."
3. "I have an autoimmune disease that causes blistering in the skin."
4. "Red, raised papules and large plaques covered by silvery scales will be present on my skin."

5. The nurse is assisting in planning care for a client with a diagnosis of immunodeficiency and would incorporate which action as a **priority** in the plan?
1. Protecting the client from infection
2. Providing emotional support to decrease fear
3. Encouraging discussion about lifestyle changes
4. Identifying factors that decreased the immune function

6. A client calls the nurse in the emergency department and reports being just stung by a bumblebee while gardening. The client is afraid of a severe reaction because the client's neighbor experienced such a reaction just 1 week ago. Which action would the nurse take?
1. Advise the client to soak the site in hydrogen peroxide.
2. Ask the client if they ever sustained a bee sting in the past.
3. Tell the client to call an ambulance for transport to the emergency department.
4. Tell the client not to worry about the sting unless difficulty with breathing occurs.

7. The community health nurse is conducting a research study and is identifying clients in the community at risk for latex allergy. Which client population is **most** at risk for developing this type of allergy?
1. Hairdressers
2. The homeless
3. Children in day care centers
4. Individuals living in a group home

Telegram & Insta: NCLEX_RN_Edu

8. Which interventions apply in the care of a client at high risk for an allergic response to a latex allergy? **Select all that apply.**
   - ❑ 1. Use nonlatex gloves.
   - ❑ 2. Use medications from glass ampules.
   - ❑ 3. Place the client in a private room only.
   - ❑ 4. Keep a latex-safe supply cart available in the client's area.
   - ❑ 5. Avoid the use of medication vials that have rubber stoppers.
   - ❑ 6. Use only a blood pressure cuff from an electronic device to measure the blood pressure.

9. A client presents at the primary health care provider's office with complaints of a ringlike rash on the upper leg. Which question would the nurse ask **first**?
   1. "Do you have any cats in your home?"
   2. "Have you been camping in the last month?"
   3. "Have you or close contacts had any flulike symptoms within the last few weeks?"
   4. "Have you been in physical contact with anyone who has the same type of rash?"

10. A client is diagnosed with scleroderma. Which intervention would the nurse anticipate to be prescribed?
    1. Maintain bed rest as much as possible.
    2. Administer corticosteroids as prescribed for inflammation.
    3. Advise the client to remain supine for 1 to 2 hours after meals.
    4. Keep the room temperature warm during the day and cool at night.

11. A client arrives at the health care clinic and tells the nurse that they were just bitten by a tick and would like to be tested for Lyme disease. The client tells the nurse that the tick was removed and flushed down the toilet. Which actions are **most appropriate**? **Select all that apply.**
    - ❑ 1. Tell the client that testing is not necessary unless arthralgia develops.
    - ❑ 2. Tell the client to avoid any woody, grassy areas that may contain ticks.
    - ❑ 3. Instruct the client to immediately start to take the antibiotics that are prescribed.
    - ❑ 4. Inform the client to plan to have a blood test 4 to 6 weeks after a bite to detect the presence of the disease.
    - ❑ 5. Tell the client that if this happens again, to never remove the tick but to vigorously scrub the area with an antiseptic.

12. The client with acquired immunodeficiency syndrome is diagnosed with cutaneous Kaposi's sarcoma. Based on this diagnosis, the nurse understands that this has been confirmed by which finding?
    1. Swelling in the genital area
    2. Swelling in the lower extremities
    3. Positive punch biopsy of the cutaneous lesions
    4. Appearance of reddish-blue lesions noted on the skin

13. The nurse is conducting allergy skin testing on a client. Which postprocedure interventions are **most appropriate**? **Select all that apply.**
    - ❑ 1. Record site, date, and time of the test.
    - ❑ 2. Give the client a list of potential allergens if identified.
    - ❑ 3. Estimate the size of the wheal and document the finding.
    - ❑ 4. Tell the client to return to have the site inspected only if there is a reaction.
    - ❑ 5. Have the client wait in the waiting room for at least 1 to 2 hours after injection.

14. The nurse is performing an assessment on a client who has been diagnosed with an allergy to latex. In determining the client's risk factors, the nurse would question the client about an allergy to which food item?
    1. Eggs
    2. Milk
    3. Yogurt
    4. Bananas

ANSWERS

1. *Answer:* 2

Rationale: Gowns and gloves are required if the nurse anticipates contact with soiled items such as those with wound drainage or if the nurse is caring for a client who is incontinent with diarrhea or a client who has an ileostomy or colostomy. Masks are not required unless droplet or airborne precautions are necessary. Regardless of the amount of wound drainage, a gown and gloves must be worn.

Test-Taking Strategy: Focus on the subject, the method of transmission of infection from Kaposi's sarcoma. Read the question, noting the task that is presented; in this case, it is bathing and changing linens. Eliminate option 3, because the method of transmission is not respiratory. Eliminate options 1 and 4 because neither provides adequate protection based on the method of transmission.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 408-409.

2. *Answer:* 1

Rationale: To help reduce fatigue in the client with systemic lupus erythematosus, the nurse would instruct the client to sit whenever possible, avoid hot baths (because they exacerbate

Telegram & Insta: NCLEX_RN_Edu

fatigue), schedule moderate low-impact exercises when not fatigued, and maintain a balanced diet. The client is instructed to avoid long periods of rest because it promotes joint stiffness.
Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and the need to select the incorrect client statement. Also, focus on the **subject,** fatigue. This will assist in directing you to the correct option as the action that would exacerbate fatigue.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1521-1522.

3. *Answer:* 1, 2, 3
Rationale: An anaphylactic reaction requires immediate action, starting with quickly assessing the client's respiratory status. Although the PHCP and the Rapid Response Team must be notified immediately, the nurse must stay with the client. Oxygen is administered and an IV of normal saline is started and infused per PHCP prescription. Documentation of the event, actions taken, and client outcomes needs to be performed. The head of the bed needs to be elevated if the client's blood pressure is normal.
Test-Taking Strategy: Focus on the **subject,** interventions the nurse takes for an anaphylactic reaction. Read each option carefully and remember that this is an emergency. Think about the pathophysiology that occurs in this reaction to answer correctly.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 199-201.

4. *Answer:* 3
Rationale: Pemphigus is an autoimmune disease that causes blistering in the epidermis. The client has large flaccid blisters (bullae). Because the blisters are in the epidermis, they have a thin covering of skin and break easily, leaving large denuded areas of skin. On initial examination, clients may have crusting areas instead of intact blisters. Option 1 describes eczema, option 2 describes herpes zoster, and option 4 describes psoriasis.
Test-Taking Strategy: Focus on the **subject,** the characteristics of pemphigus. Think about the pathophysiology associated with this disorder and recall that pemphigus vulgaris is an autoimmune disorder.
Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. p. 183.

5. *Answer:* 1
Rationale: The client with immunodeficiency has inadequate or absence of immune bodies and is at risk for infection. The priority nursing intervention would be to protect the client from infection. Options 2, 3, and 4 may be components of care but are not the priority.
Test-Taking Strategy: Note the **strategic word,** *priority*. Use **Maslow's Hierarchy of Needs theory** to answer the question. Remember that physiological needs are the priority. This will direct you to the correct option.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 202-203.

6. *Answer:* 2
Rationale: In some types of allergies, a reaction occurs only on second and subsequent contacts with the allergen. The appropriate action, therefore, would be to ask the client if they ever experienced a bee sting in the past. Option 1 is inappropriate advice. Option 3 is unnecessary. The client would not be told "not to worry."
Test-Taking Strategy: Use the **steps of the nursing process** to answer the question. The correct option is the only one that addresses assessment, the first step.
Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. p. 182.

7. *Answer:* 1
Rationale: Individuals most at risk for developing a latex allergy include health care workers; individuals who work in the rubber industry; or those who have had multiple surgeries, have spina bifida, wear gloves frequently (such as food handlers, hairdressers, and auto mechanics), or are allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, or water chestnuts.
Test-Taking Strategy: Focus on the **subject,** a latex allergy, and note the **strategic word**, *most*. Recalling the sources of latex and of the allergic reaction will direct you easily to the correct option.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 201.

8. *Answer:* 1, 2, 4, 5
Rationale: Most health care facilities use latex-free products and supplies but there may be some supplies that are not available as latex-free. If a client is allergic to latex and is at high risk for an allergic response, the nurse would use nonlatex gloves and latex-safe supplies, and would keep a latex-safe supply cart available in the client's area. Any supplies or materials that contain latex would be avoided. These include blood pressure cuffs and medication vials with rubber stoppers that require puncture with a needle. It is unnecessary to place the client in a private room.
Test-Taking Strategy: Focus on the **subject,** the client at high risk for an allergic response to latex. Recalling that items that contain rubber are likely to contain latex will direct you to the correct interventions. Also, noting the **closed-ended word** "only" in options 3 and 6 will assist in eliminating these options.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 201.

9. *Answer:* 2
Rationale: The nurse would ask questions to assist in identifying a cause of Lyme disease, which is a multisystem infection that results from a bite by a tick carried by several species of

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

deer. The rash from a tick bite can be a ringlike rash occurring 3 to 4 weeks after a bite and is commonly seen on the groin, buttocks, axillae, trunk, and upper arms or legs. Option 1 is referring to toxoplasmosis, which is caused by the inhalation of cysts from contaminated cat feces. Lyme disease cannot be transmitted from one person to another.

Test-Taking Strategy: Focus on the **strategic word**, *first*. Also focus on the **data in the question**. Eliminate options 3 and 4 because they are **comparable or alike**. It is important in the initial assessment for the nurse to determine the cause of the rash. If the client sustained a bite while out in the woods, Lyme disease should be suspected.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1515-1516.

10. *Answer:* 2

Rationale: Scleroderma is a chronic connective tissue disease similar to systemic lupus erythematosus. Corticosteroids may be prescribed to treat inflammation. Topical agents may provide some relief from joint pain. Activity is encouraged as tolerated, and the room temperature needs to be constant. Clients need to sit up for 1 to 2 hours after meals if esophageal involvement is present.

Test-Taking Strategy: Focus on the **subject,** scleroderma. Think about the pathophysiology associated with this condition and read each option carefully to assist in answering correctly.

Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. p. 1030.

11. *Answer:* 2, 3, 4

Rationale: A blood test is available to detect Lyme disease; however, the test is unreliable if performed before 4 to 6 weeks following the tick bite. Antibody formation takes place in the following manner: Immunoglobulin M is detected 3 to 4 weeks after Lyme disease onset, peaks at 6 to 8 weeks, and then gradually disappears; immunoglobulin G is detected 2 to 3 months after infection and may remain elevated for years. Areas that ticks inhabit need to be avoided. Ticks need to be removed with tweezers; then the area is washed with an antiseptic. Options 1 and 5 are incorrect.

Test-Taking Strategy: Focus on the **subject,** measures to take if Lyme disease is suspected. Also note the **strategic words**, *most appropriate*. Eliminate option 1, because treatment needs to begin before the arthralgia develops. Eliminate option 5, because ticks need to be removed.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 359-360.

12. *Answer:* 3

Rationale: Kaposi's sarcoma lesions begin as red, dark blue, or purple macules on the lower legs that change into plaques. These large plaques ulcerate or open and drain. The lesions spread by metastasis through the upper body and then to the face and oral mucosa. They can move to the lymphatic system, lungs, and gastrointestinal tract. Late disease results in swelling and pain in the lower extremities, penis, scrotum, or face. Diagnosis is made by punch biopsy of cutaneous lesions and biopsy of pulmonary and gastrointestinal lesions.

Test-Taking Strategy: Focus on the **subject,** diagnosing Kaposi's sarcoma. Eliminate options 1 and 2 first, because these symptoms occur late in the development of Kaposi's sarcoma. Then, note the word *confirmed* in the question. This word will assist in directing you to the option that will confirm the diagnosis, the biopsy of the lesions.

Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology.* (7th ed.). St. Louis: Elsevier. p. 1034.

13. *Answer:* 1, 2

Rationale: Skin testing involves administration of an allergen to the surface of the skin or into the dermis. Site, date, and time of the test must be recorded, and the client must return at a specific date and time for a follow-up site evaluation, even if no reaction is suspected. A list of potential allergens is identified and reviewed and given to the client. For the follow-up evaluation, the size of the site has to be measured and not estimated. After injection, clients need to be monitored for only about 30 minutes to assess for any adverse effects.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Eliminate option 3, because any results must be accurately measured and not estimated. Eliminate option 4 because of the **closed-ended word** "only." Eliminate option 5, because it is unreasonable to have the client wait 1 to 2 hours.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 346-347, 434.

14. *Answer:* 4

Rationale: Individuals who are allergic to kiwis, bananas, pineapples, tropical fruits, grapes, avocados, potatoes, hazelnuts, or water chestnuts are at risk for developing a latex allergy. This is thought to be the result of a possible cross-reaction between the food and the latex allergen. Options 1, 2, and 3 are unrelated to latex allergy.

Test-Taking Strategy: Recall knowledge regarding the food items related to a latex allergy. Eliminate options 1, 2, and 3 because they are **comparable or alike** and relate to dairy products.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 201.

CHAPTER 64

Immune Medications

Contributors: Lisa Nicholas, MSN, RN
James Guilbault, PharmD, BS, RPh

Telegram & Insta: NCLEX_RN_Edu

PRIORITY CONCEPTS **Immunity; Safety**

I. Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

A. Medications include nucleoside-nucleotide reverse transcriptase inhibitors (NRTIs), nonnucleoside reverse transcriptase inhibitors (NNRTIs), protease inhibitors (PIs), and fusion inhibitors (Box 64.1).

B. NRTIs and NNRTIs work by inhibiting the activity of reverse transcriptase.

C. PIs work by interfering with the activity of the enzyme protease.

D. Fusion inhibitors work by inhibiting the binding of HIV to cells.

E. Standard treatment consists of using three or four medications in regimens known as *highly active antiretroviral therapy (HAART);* this therapy is not curative but can delay or reverse loss of immune function, preserve health, and prolong life.

F. Other medications include those that are used to treat complications or opportunistic infections that develop (see Box 64.1).

G. Nucleoside-nucleotide reverse transcriptase inhibitors (NRTIs)

1. Abacavir: Can cause nausea; monitor for hypersensitivity reaction, including fever, nausea, vomiting, diarrhea, lethargy, malaise, sore throat, shortness of breath, cough, and rash
2. Abacavir/lamivudine: In addition to the effects that can occur from abacavir and lamivudine, hypersensitivity reactions, lactic acidosis, and severe hepatomegaly can occur.
3. Didanosine: Can cause nausea, diarrhea, peripheral neuropathy, hepatotoxicity, and pancreatitis
4. Emtricitabine: Can cause headache, diarrhea, nausea, rash, hyperpigmentation of the palms and soles, lactic acidosis, and severe hepatomegaly
5. Emtricitabine/tenofovir: In addition to the effects that can occur from emtricitabine and tenofovir (see later), lactic acidosis and severe hepatomegaly can occur.
6. Lamivudine: Causes nausea and nasal congestion
7. Lamivudine/zidovudine: Can cause anemia and neutropenia and lactic acidosis with hepatomegaly
8. Lamivudine/zidovudine/abacavir: In addition to the effects that can occur from lamivudine, zidovudine (see later), and abacavir, hypersensitivity reactions, anemia, neutropenia, lactic acidosis, and severe hepatomegaly can occur.
9. Stavudine: Can cause peripheral neuropathy and pancreatitis
10. Tenofovir: Can cause nausea and vomiting
11. Zidovudine: Can cause nausea, vomiting, anemia, leukopenia, myopathy, fatigue, and headache

H. Nonnucleoside reverse transcriptase inhibitors (NNRTIs)

1. Delavirdine: Can cause rash, liver function changes, and pruritus
2. Doravirine: Can cause dizziness, fatigue, headache, rash, gastrointestinal (GI) disturbances, abnormal dreams
3. Efavirenz: Can cause rash, dizziness, confusion, difficulty concentrating, abnormal dreams, and encephalopathy

Telegram & Insta: NCLEX_RN_Edu

BOX 64.1 Medications for Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

Nucleoside-Nucleotide Reverse Transcriptase Inhibitors (NRTIs)
- Abacavir
- Abacavir/lamivudine
- Didanosine
- Emtricitabine
- Emtricitabine/tenofovir
- Lamivudine
- Lamivudine/zidovudine
- Lamivudine/zidovudine/abacavir
- Stavudine
- Tenofovir
- Zidovudine

Nonnucleoside Reverse Transcriptase Inhibitors (NNRTIs)
- Delavirdine
- Doravirine
- Efavirenz
- Etravirine
- Nevirapine
- Rilpivirine

Protease Inhibitors (PIs)
- Atazanavir
- Darunavir
- Fosamprenavir
- Indinavir
- Lopinavir/ritonavir
- Nelfinavir
- Ritonavir
- Saquinavir
- Tipranavir

Integrase Inhibitors
- Dolutegravir
- Elvitegravir
- Raltegravir

Fusion Inhibitor
- Enfuvirtide

Chemokine Receptor 5 (CCR5) Antagonist
- Maraviroc

Antiinflammatory Medication
- Sulfasalazine

Antiinfective Medications
- Atovaquone
- Metronidazole
- Pentamidine isethionate
- Sulfamethoxazole/trimethoprim

Antifungal Medications
- Amphotericin B
- Fluconazole
- Itraconazole
- Ketoconazole
- Voriconazole

Antiviral Medications
- Acyclovir
- Foscarnet
- Ganciclovir
- Valacyclovir

4. Etravirine: Can cause rash, gastrointestinal disturbances, headache, hypertension, and peripheral neuropathy
5. Nevirapine: Can cause rash, Stevens-Johnson syndrome, hepatitis, and increased transaminase levels
6. Rilpivirine can cause headache, nausea, stomach pain, rash, dizziness, and feelings of sleepiness during the daytime.

I. Protease inhibitors (PIs)
1. Atazanavir: Can cause nausea, headache, infection, vomiting, diarrhea, drowsiness, insomnia, fever, hyperglycemia, hyperlipidemia, and increased bleeding in clients with hemophilia
2. Darunavir: Can cause diarrhea, nausea, vomiting, heartburn, stomach pain, headache, rash, changes in the shape and location of body fat
3. Fosamprenavir: Can cause nausea, vomiting, headache, altered taste sensations, perioral paresthesia, rashes, and altered liver function
4. Indinavir: Can cause nausea, diarrhea, hyperbilirubinemia, nephritis, and kidney stones
5. Lopinavir/ritonavir: Can cause nausea, diarrhea, altered taste sensations, circumoral paresthesia, and hepatitis
6. Nelfinavir: Can cause nausea, flatulence, and diarrhea
7. Ritonavir: Can cause nausea, vomiting, diarrhea, altered taste sensations, circumoral paresthesia, hepatitis, and increased triglyceride levels
8. Saquinavir: Can cause nausea, diarrhea, photosensitivity, and headache
9. Tipranavir: Hepatotoxicity (liver damage); can also cause nausea, vomiting, diarrhea, headache, and fatigue

J. Integrase inhibitors
1. Stops HIV replication and is used in combination with other antiretroviral medications
2. Can cause nausea, diarrhea, fatigue, headache, and itching; hypersensitivity and liver problems (dolutegravir)

K. Fusion inhibitor: Enfuvirtide can cause skin irritation at injection site, fatigue, nausea, insomnia, and peripheral neuropathy.

BOX 64.2 Immunosuppressants

Calcineurin Inhibitors
- Cyclosporine
- Tacrolimus

Cytotoxic Medications
- Azathioprine
- Cyclophosphamide
- Methotrexate
- Mycophenolate mofetil
- Mycophenolic acid

Antibodies
- Basiliximab
- Lymphocyte immune globulin, antithymocyte globulin, Muromonab-CD3

Other
- Everolimus
- Sirolimus

Glucocorticoids
- See Chapter 48

L. Chemokine receptor 5 (CCR5) antagonist: Maraviroc
1. Binds with CCR5 and blocks viral entry
2. Can cause cough, dizziness, pyrexia, rash, abdominal pain, musculoskeletal symptoms, and upper respiratory tract infections; liver injury and cardiovascular events have occurred in some clients.

M. Antiinflammatory and antiinfective medications: Used to treat opportunistic infections such as *Pneumocystis jiroveci* pneumonia; toxoplasma encephalitis is treated with sulfamethoxazole/trimethoprim (see Box 64.1).

N. Antifungal medications: Used to treat candidiasis and cryptococcal meningitis (see Box 64.1)

O. Antiviral medications: Used to treat cytomegalovirus retinitis, herpes simplex, and varicella-zoster virus (see Box 64.1)

⚠ The client with HIV or AIDS is at high risk for the development of opportunistic infections.

II. Immunosuppressants (Box 64.2)

A. Description: Immunosuppressants are used for transplant recipients to prevent organ or tissue rejection and to treat autoimmune disorders such as systemic lupus erythematosus.

B. Cyclosporine
1. Used for prevention of rejection following allogeneic organ transplantation
2. Usually administered with a glucocorticoid and another immunosuppressant
3. The most common adverse effects are nephrotoxicity, infection, hypertension, and hirsutism.

C. Tacrolimus
1. Used for prevention of rejection following liver or kidney transplantation
2. Adverse effects include nephrotoxicity, neurotoxicity, gastrointestinal effects, hypertension, hyperkalemia, hyperglycemia, hirsutism, and gum hyperplasia.

D. Azathioprine
1. Generally used with renal transplant recipients
2. Can cause neutropenia and thrombocytopenia

E. Cyclophosphamide
1. Used for its immunosuppressant action to treat autoimmune disorders
2. Can cause neutropenia and hemorrhagic cystitis

F. Methotrexate
1. Used for its immunosuppressant action to treat autoimmune disorders
2. Can cause hepatic fibrosis and cirrhosis, bone marrow suppression, ulcerative stomatitis, and renal damage

G. Mycophenolate mofetil and mycophenolic acid
1. Used to prevent rejection following kidney, heart, and liver transplantation
2. Can cause diarrhea, vomiting, neutropenia, and sepsis; increases the risk of infection and malignancies, especially lymphomas

H. Basiliximab
1. Used to prevent rejection following kidney transplantation
2. Can cause severe acute hypersensitivity reactions, including anaphylaxis

I. Lymphocyte immune globulin, antithymocyte globulin, muromonab CD3
1. Used to prevent rejection following kidney, heart, liver, and bone marrow transplantation
2. Side and adverse effects include fever, chills, leukopenia, and skin reactions.
3. Can cause anaphylactoid reactions

J. Sirolimus
1. Used to prevent renal transplant rejection
2. Increases the risk of infection; raises cholesterol and triglyceride levels; can cause renal injury
3. Can cause rash, acne, anemia, thrombocytopenia, joint pain, diarrhea, and hypokalemia.
4. Everolimus can cause mouth sores, infections, swelling and edema.

⚠ Monitor the client taking an immunosuppressant closely for signs of infection.

III. Immunizations: See Chapter 19 for more information.

IV. Antimicrobials (Box 64.3)

A. Inhibit the growth of bacteria

B. Include medication classifications of aminoglycosides, cephalosporins, fluoroquinolones, macrolides, lincosamides, monobactams, penicillins and penicillinase-resistant penicillins, sulfonamides, streptogramins, tetracyclines, antimycobacterials, and others (see Box 64.3)

C. Adverse effects (Table 64.1)

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 64.3 Antimicrobials

Aminoglycosides
- Amikacin
- Gentamicin
- Neomycin
- Streptomycin
- Tobramycin

Cephalosporins
- Cefaclor
- Cefadroxil
- Cefazolin
- Cefdinir
- Cefditoren
- Cefepime
- Cefixime
- Cefotaxime
- Cefotetan
- Cefoxitin
- Cefpodoxime
- Cefprozil
- Ceftazidime
- Ceftibuten
- Ceftriaxone
- Cefuroxime
- Cephalexin

Fluoroquinolones
- Ciprofloxacin
- Gemifloxacin
- Levofloxacin
- Moxifloxacin
- Ofloxacin

Macrolides
- Azithromycin
- Clarithromycin
- Erythromycin
- Fidaxomicin

Lincosamides
- Clindamycin
- Lincomycin

Monobactam
- Aztreonam

Penicillins
- Amoxicillin
- Ampicillin
- Penicillin G
- Penicillin V
- Piperacillin

Penicillinase-Resistant Penicillins
- Dicloxacillin
- Nafcillin
- Oxacillin

Sulfonamides
- Sulfamethoxazole
- Sulfadiazine
- Sulfasalazine
- Sulfisoxazole
- Trimethoprim/sulfamethoxazole

Streptogramins
- Quinupristin/dalfopristin

Tetracyclines
- Demeclocycline
- Doxycycline
- Minocycline
- Tetracycline

Antimycobacterials
- Antituberculosis agents (see Chapter 52)
- Leprostatics: Clofazimine, Thalidomide

Antifungal Medications
- Amphotericin B
- Fluconazole
- Itraconazole
- Ketoconazole
- Posaconazole
- Voriconazole

Antiviral Medications
- Acyclovir
- Famciclovir
- Foscarnet
- Ganciclovir
- Valacyclovir

TABLE 64.1 Antimicrobials and Their Adverse Effects

Classification	Adverse Effects
Aminoglycosides	Ototoxicity
	Confusion, disorientation
	Renal toxicity
	Gastrointestinal irritation
	Palpitations, blood pressure changes
	Hypersensitivity reactions

TABLE 64.1 Antimicrobials and Their Adverse Effects—cont'd

Classification	Adverse Effects
Cephalosporins	Gastrointestinal disturbances
	Pseudomembranous colitis
	Headache, dizziness, lethargy, paresthesias
	Nephrotoxicity
	Superinfections
Fluoroquinolones	Headache, dizziness, insomnia, depression
	Gastrointestinal effects
	Bone marrow depression
	Fever, rash, photosensitivity, tendinopathy
Macrolides	Gastrointestinal effects
	Pseudomembranous colitis
	Confusion, abnormal thinking
	Superinfections
	Hypersensitivity reactions
Lincosamides	Gastrointestinal effects
	Pseudomembranous colitis
	Bone marrow depression
Monobactams	Gastrointestinal effects
	Hepatotoxicity
	Allergic reactions
Penicillins and penicillinase-resistant penicillins	Gastrointestinal effects, including sore mouth and furry tongue
	Superinfections
	Hypersensitivity reactions, including anaphylaxis
Sulfonamides	Gastrointestinal effects
	Hepatotoxicity
	Nephrotoxicity
	Bone marrow depression
	Dermatological effects, including hypersensitivity and photosensitivity
	Headache, dizziness, vertigo, ataxia, depression, seizures
Tetracyclines	Gastrointestinal effects
	Hepatotoxicity
	Teeth (staining) and bone damage
	Superinfections
	Dermatological reactions, including rash and photosensitivity
	Hypersensitivity reactions
Antimycobacterials, leprostatics	Gastrointestinal effects
	Neuritis, dizziness, headache, malaise, drowsiness, hallucinations
Antifungals	Gastrointestinal effects
	Headache, rash, anemia, hepatotoxicity
	Hearing loss, peripheral neuritis

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

D. Nursing considerations (see Clinical Judgment: Generate Solutions Box)

1. Assess for allergies.
2. Monitor appropriate laboratory values before therapy as appropriate and during therapy to assess for adverse effects.
3. Report adverse effects to the primary health care provider if any occur.
4. Determine the appropriate method of administration and provide instructions to the client.
5. Monitor intake and output.
6. Encourage fluid intake (unless contraindicated).
7. Initiate safety precautions because of possible central nervous system effects.
8. Teach the client about the medication and how to take it; emphasize the importance of completing the full prescribed course.

CLINICAL JUDGMENT: GENERATE SOLUTIONS

A hospitalized client who is receiving ceftriaxone to treat an infection develops severe diarrhea. The nurse prepares a plan of care for the client and includes the following in the plan:

- Place the client on contact precautions.
- Assess and monitor for signs of fluid and electrolyte imbalances.
- Encourage the intake of fluids such as water, broth, sugarless fruit juices, or oral rehydration drinks, avoiding beverages high in added sugars and those that contain caffeine such as coffee, tea, and colas because they will worsen the condition.
- Avoid fatty and spicy foods because they will worsen the condition.
- Contact the primary health care provider (PHCP) for a prescription for an antidiarrheal medication; some PHCPs prefer not to use antidiarrheals because they can interfere with the body's ability to eliminate toxins and lead to complications.
- Ask the PHCP about the use of probiotics because they can rebalance the healthy bacteria in the client's digestive tract.
- Monitor intake and output, and document the client's response to treatment.

PRACTICE QUESTIONS

1. The client with acquired immunodeficiency syndrome and Pneumocystis jiroveci infection has been receiving pentamidine. The client develops a temperature of 101° F (38.3° C). The nurse continues to assess the client, knowing that this sign **most likely** indicates which condition?

1. That the dose of the medication is too low
2. That the client is experiencing toxic effects of the medication
3. That the client has developed inadequacy of thermoregulation
4. That the client has developed another infection caused by leukopenic effects of the medication

2. The nurse caring for a client who is taking an aminoglycoside would monitor the client for which adverse effects of the medication? **Select all that apply.**

❑ 1. Seizures
❑ 2. Ototoxicity
❑ 3. Renal toxicity
❑ 4. Dysrhythmias
❑ 5. Hepatotoxicity

3. Ketoconazole is prescribed for a client with a diagnosis of candidiasis. Which interventions would the nurse include when administering this medication? **Select all that apply.**

❑ 1. Restrict fluid intake.
❑ 2. Monitor liver function studies.
❑ 3. Instruct the client to avoid alcohol.
❑ 4. Administer the medication with an antacid.
❑ 5. Instruct the client to avoid exposure to the sun.
❑ 6. Administer the medication on an empty stomach.

4. The nurse is caring for a client who has been taking a sulfonamide and would monitor for signs and symptoms of which adverse effects of the medication? **Select all that apply.**

❑ 1. Ototoxicity
❑ 2. Palpitations
❑ 3. Nephrotoxicity
❑ 4. Bone marrow suppression
❑ 5. Gastrointestinal (GI) effects
❑ 6. Increased white blood cell (WBC) count

5. The nurse is reviewing the results of serum laboratory studies drawn on a client with acquired immunodeficiency syndrome who is receiving didanosine. The nurse interprets that the client may have the medication discontinued by the primary health care provider if which elevated result is noted?

1. Serum protein level
2. Blood glucose level
3. Serum amylase level
4. Serum creatinine level

6. The nurse is caring for a postrenal transplantation client taking cyclosporine. The nurse notes an increase in one of the client's vital signs, and the client is complaining of a headache. What vital sign is **most likely** increased?

1. Pulse
2. Respirations
3. Blood pressure
4. Pulse oximetry

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. Amikacin is prescribed for a client with a bacterial infection. The nurse instructs the client to contact the primary health care provider (PHCP) **immediately** if which occurs?
   1. Nausea
   2. Lethargy
   3. Hearing loss
   4. Muscle aches

8. A client who is human immunodeficiency virus seropositive has been taking stavudine. The nurse would monitor which **most** closely while the client is taking this medication?
   1. Gait
   2. Appetite
   3. Level of consciousness
   4. Gastrointestinal function

ANSWERS

1. *Answer:* 4

Rationale: Frequent adverse effects of this medication include leukopenia, thrombocytopenia, and anemia. The client would be monitored routinely for signs and symptoms of infection. Options 1, 2, and 3 are inaccurate interpretations.

Test-Taking Strategy: Note the **strategic words,** *most likely*. Focus on the **data in the question.** Noting that the temperature is elevated will direct you to the correct option.

Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. pp. 1001-1002.

2. *Answer:* 2, 3, 4

Rationale: Aminoglycosides are administered to inhibit the growth of bacteria. Adverse effects of this medication include confusion, ototoxicity, renal toxicity, gastrointestinal irritation, palpitations, blood pressure changes, and hypersensitivity reactions. Therefore, the remaining options are incorrect.

Test-Taking Strategy: Focus on the **subject,** adverse effects of aminoglycosides. It is necessary to know the adverse effects associated with this medication to answer correctly. Remember that ototoxicity, renal toxicity, and dysrhythmias are adverse effects.

Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed.). St. Louis: Elsevier. pp. 1063, 1066-1067.

3. *Answer:* 2, 3, 5

Rationale: Ketoconazole is an antifungal medication. There is no reason for the client to restrict fluid intake; in fact, this could be harmful to the client. The medication is hepatotoxic, and the nurse monitors liver function. It is administered with food (not on an empty stomach), and antacids are avoided for 2 hours after taking the medication to ensure absorption. The client is also instructed to avoid alcohol. In addition, the client is instructed to avoid exposure to the sun, because the medication increases photosensitivity.

Test-Taking Strategy: Focus on the **subject,** administration procedures, and recall that ketoconazole is an antifungal medication. Next, use general medication guidelines to select the correct interventions. Also, remember that this medication is administered with food and that it is hepatotoxic.

Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. pp. 657-658, 663.

4. *Answer:* 3, 4, 5

Rationale: Adverse effects of sulfonamides include nephrotoxicity, bone marrow suppression, GI effects, hepatotoxicity, dermatological effects, and some neurological symptoms including headache, dizziness, vertigo, ataxia, depression, and seizures. Options 1, 2, and 6 are unrelated to these medications.

Test-Taking Strategy: Focus on the **subject,** adverse effects of sulfonamides. It is necessary to know the adverse effects associated with these medications to answer correctly. Remember that nephrotoxicity, bone marrow suppression, and GI symptoms are adverse effects of sulfonamides.

Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. pp. 591-592.

5. *Answer:* 3

Rationale: Didanosine can cause pancreatitis. A serum amylase level that is increased to 1.5 to 2 times normal may signify pancreatitis in the client with acquired immunodeficiency syndrome and is potentially fatal. The medication may have to be discontinued. The medication is also hepatotoxic and can result in liver failure.

Test-Taking Strategy: Focus on the **subject,** adverse effects of didanosine. Recalling that this medication can cause damage to the pancreas and is hepatotoxic will direct you to the correct option.

Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. pp. 393-395.

6. *Answer:* 3

Rationale: Hypertension can occur in a client taking cyclosporine, and because this client is also complaining of a headache, the blood pressure is the vital sign to be monitored most closely. Other adverse effects include infection, nephrotoxicity, and hirsutism. Options 1, 2, and 4 are unrelated to the use of this medication.

Test-Taking Strategy: Note the **strategic words,** *most likely*. Focus on the name of the medication, and recall that this medication can cause hypertension. Also, noting that the client has a headache will assist you in answering correctly.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 207.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. *Answer:* 3

Rationale: Amikacin is an aminoglycoside. Adverse effects of aminoglycosides include ototoxicity (hearing problems), confusion, disorientation, gastrointestinal irritation, palpitations, blood pressure changes, nephrotoxicity, and hypersensitivity. The nurse instructs the client to report hearing loss to the PHCP immediately. Lethargy and muscle aches are not associated with the use of this medication. It is not necessary to contact the PHCP immediately if nausea occurs. If nausea persists or results in vomiting, the PHCP would be notified.

Test-Taking Strategy: Note the **strategic word,** *immediately*. Recalling that this medication is an aminoglycoside (most aminoglycoside medication names end in *-cin*) and that aminoglycosides are ototoxic will direct you to the correct option.

Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed.). St. Louis: Elsevier. pp. 1063, 1066-1067.

8. *Answer:* 1

Rationale: Stavudine is an antiretroviral used to manage human immunodeficiency virus infection in clients who do not respond to or who cannot tolerate conventional therapy. The medication can cause peripheral neuropathy, and the nurse would monitor the client's gait closely and ask the client about paresthesia. Options 2, 3, and 4 are unrelated to this medication.

Test-Taking Strategy: Note the **strategic word,** *most*. Focus on the name of the medication. Recalling that this medication causes peripheral neuropathy will direct you to the correct option.

UNIT XVIII

Mental Health Problems of the Adult Client

Pyramid to Success

The Pyramid to Success focuses on the therapeutic nurse–client relationship, the rights of clients, the ethical and legal issues related to the care of a client with a mental health problem, and grief and loss. Pyramid Points also focus on the use of restraints (security devices), seclusion, and other therapies. Care for a client with an addiction, such as an eating disorder, substance abuse disorder, or gambling disorder, is another focus area. Additional areas of focus include anxiety, depression, suicide, abuse and neglect, violence, rape crisis interventions, post-traumatic stress disorder and moral injury, COVID coping, obsessive-compulsive disorders, schizophrenia, and bipolar disorders. Pyramid Points also address the use of medications prescribed for a client with a mental health problem.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

Ensuring client advocacy
Ensuring that informed consent related to treatments, such as restraints (security devices), seclusion, and other therapies, has been obtained
Implementing legal responsibilities related to reporting incidences of abuse, neglect, or violence
Maintaining confidentiality
Prioritizing hypotheses based on client needs
Providing psychiatric consultations and other interprofessional referrals
Providing safety to the client and others
Upholding client rights
Using restraints (security devices) and seclusion appropriately and safely

Health Promotion and Maintenance

Identifying community resources for the client
Identifying individual lifestyle choices
Performing psychosocial assessment techniques
Providing health promotion programs related to addictions

Psychosocial Integrity

Addressing grief and loss issues
Caring for the client who has been sexually abused or raped
Considering religious, cultural, and spiritual influences on health
Developing a therapeutic nurse–client relationship
Identifying coping mechanisms
Identifying support systems
Implementing behavioral interventions
Providing crisis intervention
Providing a therapeutic milieu
Recognizing cues that indicate abuse and neglect situations
Recognizing cues that indicate addiction
Recognizing cues that indicate domestic violence
Teaching stress-management techniques

Physiological Integrity

Analyzing cues that indicate potential complications related to medications and treatments
Evaluating outcomes related to expected and untoward effects of medications
Monitoring elimination patterns
Monitoring for alterations in body systems related to substance abuse
Monitoring laboratory values related to medication therapy
Monitoring rest and sleep patterns
Providing adequate nutrition
Providing personal hygiene measures
Recognizing cues that indicate abusive and self-destructive behavior
Taking action in emergency situations

CHAPTER 65

Foundations of Psychiatric Mental Health Nursing

Contributor: Michael Johnson, PhD, RN, PMH-BC, CNE

PRIORITY CONCEPTS Caregiving; Coping

I. Nurse–Client Relationship

A. Principles

1. Genuineness, respect, and empathic understanding are characteristics important to the development of a therapeutic nurse–client relationship.
2. The client should be cared for in a holistic manner.
3. The nurse considers the client's cultural and spiritual beliefs and values in assessing the client's response to the nurse–client relationship and the client's adaptation to stressors.
4. Appropriate limits and boundaries define and facilitate a therapeutic nurse–client relationship.
5. Honest and open communication is important for the development of trust, an underpinning of the therapeutic nurse–client relationship.
6. The nurse uses therapeutic communication techniques to encourage the client to express thoughts and feelings as they address identified problem areas.
7. The nurse respects the client's confidentiality and limits discussion of the client to the interprofessional health care team.
8. The goal of the nurse–client relationship is to assist the client to develop problem-solving abilities and coping mechanisms.

The nurse needs to consider the cultural, religious, and spiritual practices of the client and whether these practices may give the client hope, comfort, and support while healing.

B. Phases of a therapeutic nurse–client relationship

1. Preinteraction phase
   - **a.** Begins before the nurse's first contact with the client
   - **b.** Develops appropriate physical and interpersonal environment (seating, lighting) to promote comfort and facilitate collaboration
   - **c.** Anticipates potential client issues
   - **d.** Prepares for the client interaction
   - **e.** Determines how to initially approach client
   - **f.** The nurse should identify personal preconceived ideas, stereotypes, biases, and values that may impinge on the nurse–client relationship.
2. Orientation or introductory phase
   - **a.** Acceptance, rapport, trust, and boundaries are established.
   - **b.** Introduces self to the client by using first and last name and designation
   - **c.** Identifies purpose and the time frame of the relationship (establishing a contract)
   - **d.** Identifies client's strengths and needs
   - **e.** Collects data and forms basis for diagnosis and client-centered goals
   - **f.** Termination and separation of the relationship are discussed in anticipation of the time-limited nature of the relationship.
3. Working phase
   - **a.** Exploring, focusing on, and evaluating the client's concerns and problems occur; an attitude of acceptance and active listening assists the client to express thoughts and feelings.
   - **b.** Actively problem solves with the client
   - **c.** Uses interpersonal strategies to help the client identify effective coping strategies
   - **d.** Encourages self-direction and self-management whenever possible to promote health and wellness
4. Termination or separation phase
   - **a.** Prepares the client for termination and separation on initial contact
   - **b.** Evaluates progress and achievement of goals
   - **c.** Identifies responses related to termination and separation, such as anger, distancing from the relationship, a return of symptoms, and dependency

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

d. Encourages the client to express feelings about termination
e. Identifies the client's strengths and anticipated needs for follow-up care
f. Refers the client to community resources and other support systems

C. Family as an extension of the client
1. Family members should be viewed as collaborators in the management of a client's mental health needs (maintain confidentiality as necessary).
2. Competence and caring focused toward family members enhance the nurse's ability to identify client and family needs and to select and implement effective interventions directed toward promoting adaptive functioning.
3. Nurses have a professional obligation to be aware of and sensitive to the cultural, ethnic, religious, and spiritual factors that affect the family structure and resulting needs of the client and the client's family.
4. Educating family members regarding the client's mental health problem, identification of symptoms, and effective management of maladaptive behaviors plays a vital role in the client's quality of life.

D. Impact of culture, ethnicity, religion, and spirituality on client care
1. Cultural competency and sensitivity allow the nurse to recognize the uniqueness of each client and the impact that culture, values, and religious and spiritual beliefs have on an individual's mental health as well as the treatment required for an existing mental health problem.
2. A client's culture, ethnicity, values, and religious and spiritual belief systems can affect all aspects of mental health care, including medication therapies, and can act as either protective or risk factors when dealing with the development and/or treatment of mental health problems.
3. Nurses must be aware of the impact that their own cultural backgrounds, religious and spiritual beliefs, and values have on the care they provide to avoid biases.
4. The treatment plan must be agreed upon by both client and nurse and take into consideration the needs of the client whenever possible.

II. Therapeutic Communication Process

A. Principles
1. Communication includes verbal and nonverbal expression (Fig. 65.1).

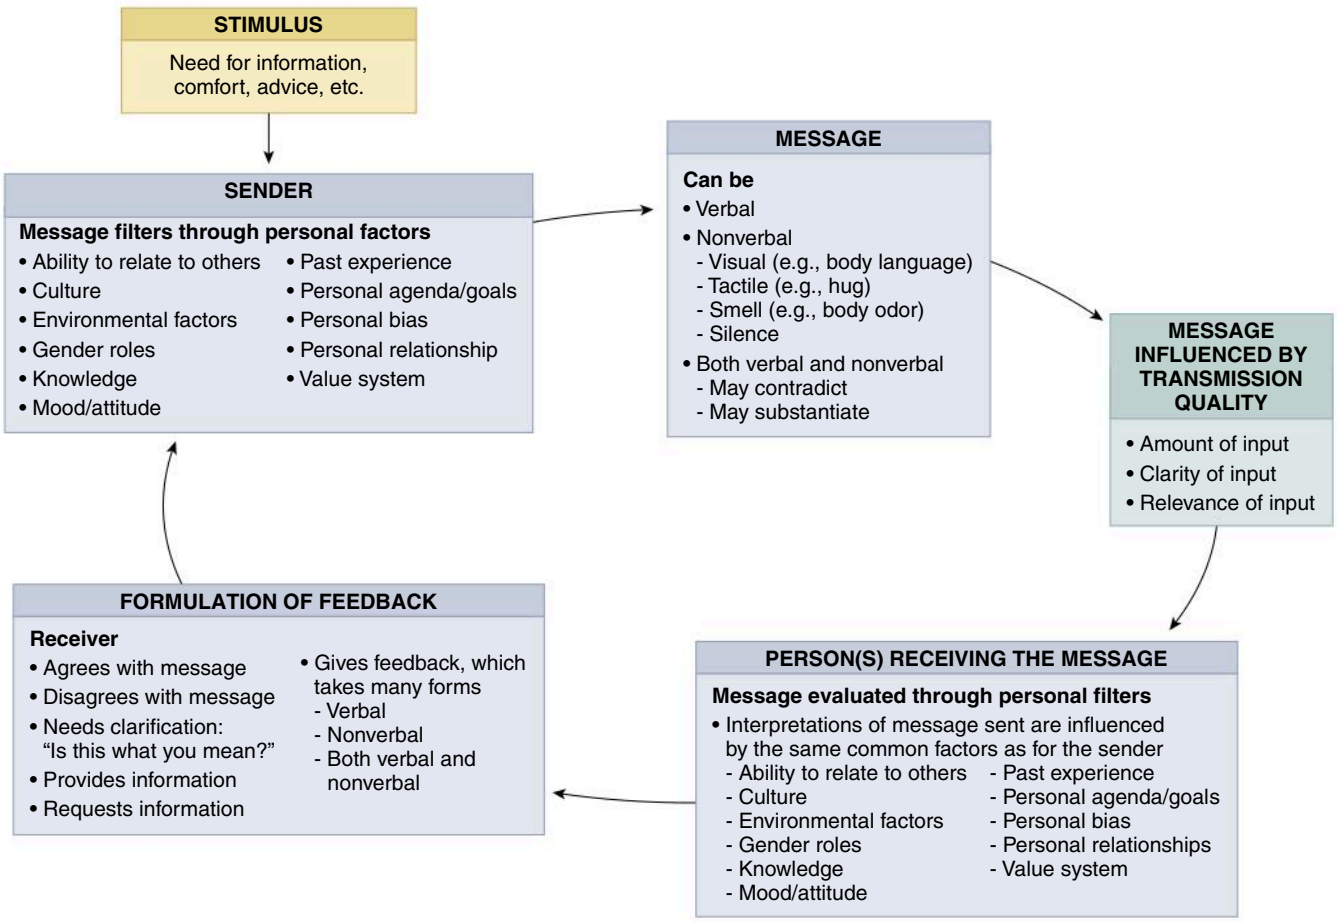

FIG. 65.1 Operational definition of communication.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Successful communication includes appropriateness, efficiency, flexibility, and feedback.
3. Anxiety in the nurse or client impedes communication.
4. Communication needs to be goal-directed within a professional framework.

B. Therapeutic and nontherapeutic communication techniques (Table 65.1)

III. Mental Health

A. Mental health is a lifelong process of successful adaptation to changing internal and external environments.

TABLE 65.1 Therapeutic (Effective) and Nontherapeutic (Ineffective) Communication Techniques

Therapeutic Techniques	
Technique	**Description**
Active listening	Carefully noting what the client is saying and observing the client's nonverbal behavior
Broad openings	Encouraging the client to select topics for discussion
Clarifying	Providing a means for making the message clearer, correcting any misunderstandings, and promoting mutual understanding
Exploring	Examining important ideas, experiences, or relationships more fully
Focusing	Directing the conversation on the topic being discussed
Informing	Giving information to the client
Offering self to help	Includes staying with the client, talking to the client, and offering to help the client
Open-ended questions	Encouraging conversation because these questions require more than one-word answers
Paraphrasing	Restating in different words what the client said
Reflecting	Directing the client's question or statement back to the client for consideration
Restating	Repeating what the client has said and directing the statement back to the client to provide the client the opportunity to agree or disagree or to clarify the message further
Silence	Allowing time for formulating thoughts
Summarizing	Stating briefly what was discussed during the conversation
Validating	Verifying that both the nurse and the client are interpreting the topic or message in the same way
Nontherapeutic Techniques	
Technique	**Description**
Approval	Implying that the client is thinking or doing the right thing and is not thinking or doing what is wrong; this may direct the client to focus on thinking or behavior that pleases the nurse
Asking excessive questions	Demanding information from the client without respect for the client's willingness or readiness to respond
Changing the subject	Avoiding addressing the client's thoughts, feelings, or concerns; implying that the client's statement is unimportant
Closed-ended questions	Questions that ask for specific information such as a "yes" or "no" answer and therefore inhibit communication
Disagreeing	Opposing the client's thinking or opinions, implying that the client is wrong
Disapproving	Indicating a negative value judgment about the client's behavior or thoughts
False reassurance	Making a statement that implies that the client has no reason to be worried or concerned; belittling a client's concerns
Giving advice	Assuming that the client cannot think for themself, which inhibits problem solving and fosters dependence
Minimizing the client's feelings	Making a statement that implies that the client's feelings are unimportant
Parroting	Repeating the client's words before determining what the client has said
Placing the client's feelings on hold	Avoiding addressing the client's thoughts, feelings, or concerns; making a statement that places the responsibility of addressing the client's thoughts, feelings, or concerns elsewhere or on another person
Value judgments	Making a comment that addresses the client's morals; this can make the client feel angry or guilty or as though they are not being supported
"Why?" questions	May cause the client to feel defensive, because many times the client does not know the reason "why"; these types of questions also often imply criticism

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

B. A mentally healthy individual is *in contact with reality*, can relate to people and situations in their environment, and can resolve conflicts within a problem-solving framework.

C. A mentally healthy individual has psychobiological resilience.

IV. Mental Health Problems

A. Mental health is on a continuum that ranges from complete mental health with high levels of well-being and functioning to serious mental illness with significant functional impairments that impact daily functioning.

B. Nurses need to be familiar with serious mental health problems.

C. Description of serious mental health problems

1. A mental health problem can cause the loss of the ability to respond to the internal and external environment in ways that are in harmony with oneself or the expectations of society.
2. It is characterized by thought or behavioral patterns that impair functioning and cause distress.

D. Characteristics of mental health problems

1. Self-concept may be distorted.
2. Thoughts and perceptions may not be reality-based.
3. The ability to find meaning and purpose in life may be impaired.
4. Life direction and productivity may be disturbed.
5. May be unable to care for one's own needs.
6. Excessive reliance or preoccupation on the thoughts, opinions, and actions of self or others may be present.

E. Adaptations to stress

1. People with serious mental health problems may have an impaired ability to adapt to stress.
2. The individual's sense of self-control may be affected.
3. Perception of the environment may be distorted.
4. Coping mechanisms may not exist or may be ineffective.

F. Interpersonal relationships

1. Interpersonal relationships may be minimally existent or may be negatively affected.
2. The ability to enjoy sustained intimacy in relationships is impaired.

V. Coping and Defense Mechanisms (see Clinical Judgment: Generate Solutions box)

A. Coping mechanisms

1. Coping involves any effort to decrease anxiety.
2. Coping mechanisms can be constructive or destructive, task- or problem-oriented in relation to direct problem solving, cognitively oriented in an attempt to neutralize the meaning of the problem, or defense- or emotion-oriented, thus regulating the response to protect oneself.

CLINICAL JUDGMENT: GENERATE SOLUTIONS

A nurse is assisting a client to apply learned coping mechanisms to decrease anxiety, and is discussing how these skills should be applied in order of priority. The nurse would instruct the client, as a priority, to first identify the source of the anxiety. Next, the nurse would explore with the client the various methods to reduce the anxiety, such as relaxation methods.

B. Defense mechanisms (see Clinical Judgment: Evaluate Outcomes box)

1. As anxiety increases, the individual copes by using defense mechanisms.
2. A defense mechanism is a coping mechanism used in an effort to protect the individual from feelings of anxiety; as anxiety increases and becomes overwhelming, the individual copes by using defense mechanisms to protect the ego and decrease anxiety (Table 65.2).

! Coping mechanisms and defense mechanisms are used by the client as protection from unmanageable stress and to decrease anxiety.

CLINICAL JUDGMENT: EVALUATE OUTCOMES

A nurse is working with a client and evaluating the client's constructive use of defense mechanisms as a coping mechanism. A defense mechanism is a coping mechanism used in an effort to protect oneself from feelings of anxiety. The client may use a defense mechanism as a protection from anxiety. As anxiety increases and becomes overwhelming for the client, the defense mechanism protects the ego, thereby decreasing the anxiety. The nurse would facilitate appropriate and constructive use of the defense mechanism that the client uses to protect self, and would evaluate whether the mechanism used by the client is effective or creates additional distress, never criticizing the client's behavior during the encounter.

C. Interventions

1. Assist the client to identify the source of anxiety and to explore methods to reduce anxiety.
2. Assess the client's use of defense mechanisms.
3. Facilitate appropriate use of defense mechanisms.
4. Determine whether the defense mechanisms used by the client are effective or create additional distress.
5. Avoid arguing with the client or criticizing the client's behavior or use of defense mechanisms.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 65.2 Defense Mechanisms

Defense Mechanism	Example
Compensation: Putting forth extra effort to counterbalance perceived deficiencies by emphasizing strengths	A business person perceives self with a small physical stature negatively and tries to overcome this by being aggressive, forceful, and controlling in business dealings.
Conversion: The expression of emotional conflicts through physical symptoms that have no organic cause	A person develops chronic abdominal pain after an emotionally traumatic event. There was no identifiable cause found for the symptoms.
Denial: Ignoring the existence of unpleasant or intolerable thoughts, feelings, needs, or impulses	A 42-year-old client has just been told that the breast biopsy indicates a malignancy. When the spouse visits that evening, the client tells the spouse that the physician has not yet discussed the laboratory results.
Displacement: Feelings about a person, object, or situation are directed to another less-threatening person, object, or situation	A 4-year-old child is angry because of being punished by a parent for drawing on the bedroom walls. The child begins to play war with soldier toys and has them fight each other.
Dissociation: The blocking of an anxiety-provoking event or period of time from the consciousness, memory, or perception to compartmentalize uncomfortable or unpleasant aspects of oneself	A person is brought to the emergency room by the police and is unable to explain who they are and where they live or work.
Identification: The conscious or unconscious attempt to change oneself to resemble an admired person	A 15-year-old adolescent gets a hair style like that of a young English teacher, whom the adolescent admires.
Intellectualization: Excessive reasoning of an event based solely on facts without involving feelings or emotion; the thinking is disconnected from feelings, and situations are dealt with at a cognitive level.	A person avoids dealing with anxiety in shopping malls by explaining that shopping is a frivolous waste of time and money.
Introjection: A type of identification in which individuals incorporate the traits or values of others into themselves	An 8-year-old child tells a 3-year-old sibling, "Don't scribble in your book of nursery rhymes. Just look at the pretty pictures," thus expressing the parents' values.
Isolation: Response in which a person blocks feelings associated with an unpleasant experience	A medical student dissects a cadaver for an anatomy course without being disturbed by thoughts of death.
Projection: Transferring one's internal feelings, thoughts, and unacceptable ideas and traits to someone else	A young person who denies sexual feelings about a coworker accuses the coworker of attempting seductive behavior without any basis for it.
Rationalization: An attempt to make unacceptable feelings and behaviors acceptable by justifying the behavior	A student fails an examination and complains that the lectures were not well organized or clearly presented.
Reaction formation: Developing conscious attitudes and behaviors and acting out behaviors opposite to what one really feels	A married person who feels attracted to one of a spouse's friends treats the friend rudely.
Regression: Returning to an earlier developmental stage and pattern of behavior to express an impulse to deal with anxiety	A 4-year-old child who has been toilet-trained for more than 1 year begins to wet pants again when a new baby is brought home from the hospital.
Repression: An unconscious process in which the client blocks undesirable and unacceptable thoughts or ideas from conscious expression	A person does not recall hitting the spouse when told about the spouse's pregnancy.

Adapted from Stuart, G. (2013). *Principles and practice of psychiatric nursing.* (10th ed.). St. Louis: Mosby. p. 226.

6. Do not take defense coping mechanism away until client has established more appropriate coping strategies to effectively deal with stressors.

VI. Diagnostic and Statistical Manual of Mental Health Disorders

A. The *Diagnostic and Statistical Manual of Mental Health Disorders,* published by the American Psychiatric Association, provides guidelines for health care personnel for identifying and categorizing mental health problems.

B. The manual addresses population groups and mental health problems that may be associated with a particular group.

C. The manual is a system used in clinical, research, and educational settings, in which diagnostic criteria are included for each mental health problem.

D. Dual diagnosis: Refers to the client who has both a mental health problem and a substance-related problem; also known as comorbidity or co-occurring problems

E. See American Psychiatric Association for updates: http://www.dsm5.org/Pages/Default.aspx

VII. Types of Mental Health Admissions and Discharges

A. Voluntary admission

1. The client (or the client's guardian) seeks admission for care.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. The voluntary client is free to sign out of the hospital with psychiatrist or primary health care provider (PHCP) notification and prescription.
3. Detaining voluntary clients against their will is termed *false imprisonment.*
4. The client retains full civil rights (Patient Care Partnership) (Box 65.1).

B. Right to confidentiality

1. Clients have a right to confidentiality of their medical information; the Health Insurance Portability and Accountability Act (HIPAA) of 1996 ensures client confidentiality with regard to the release and electronic transmission of data.
2. Information sometimes must be released in life-threatening situations without the client's consent.
3. In the event of a specific threat against an identified individual, the health care professional has a legal obligation to warn the intended victim of a client's threats of harm.

Except in an emergency situation, client information can be released only with the client's informed consent, which specifies the information that can be released and the time frame for which the release is valid.

C. Involuntary admission

1. Involuntary admission may be necessary when a person is mentally ill, is a danger to self or others, or is in need of mental health treatment or physical care.
2. Involuntary admission occurs when a person is admitted or detained involuntarily for mental health treatment because of actual or imminent danger to self or others; the person's condition is deteriorating, and they require hospitalization.
3. Clients who are admitted involuntarily retain their right to informed consent.
4. Clients retain the right to refuse treatments, including medications, unless a separate and specific treatment order is obtained from the court.
5. Clients lose the right to refuse treatment when they pose an immediate danger to self or others, requiring immediate action by the interprofessional health care team.
6. Depending on the jurisdiction, an order from an external board such as a court or from the psychiatrist or PHCP is required for involuntary admissions except in the case of emergency, which allows time to obtain the necessary order from the board; in the case of all involuntary admissions, legal counsel must be provided for the client. In this situation, the client may be held for a 72-hour period until further evaluation is completed.

BOX 65.1 Patient Care Partnership/Client Rights

- Right to communicate with people outside the hospital through correspondence, telephone, and personal visits
- Right to keep clothing and personal effects with them in the hospital
- Right to religious freedom
- Right to be employed if possible
- Right to manage and dispose of property
- Right to execute wills
- Right to enter into contractual relationships
- Right to make purchases
- Right to education
- Right to habeas corpus
- Right to independent mental health examination
- Right to civil service status
- Right to retain licenses, privileges, or permits established by law, such as a driver's or professional license
- Right to sue or be sued
- Right to marry and divorce
- Right not to be subject to unnecessary mechanical restraints
- Right to periodic review of status
- Right to legal representation
- Right to privacy
- Right to informed consent
- Right to treatment
- Right to refuse treatment
- Right to treatment in the least restrictive setting

NOTE: State and province laws should always be followed.
Data from Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 63-64.

7. A hearing is held by an external board within a specified time period for a client admitted involuntarily; the specific time period varies by state. The psychiatrist or PHCP may also be the person making decisions surrounding client discourse, depending on location.
8. In most states, a client can institute a hearing to seek an expedient judicial discharge (a writ of habeas corpus).
9. At the hearing, a determination is made as to whether the client may be released from the hospital or detained for further treatment and evaluation, or committed to a mental health facility for an undetermined period.
10. A client has the right to treatment in the least restrictive treatment environment; if treatment objectives can be achieved by court-ordered treatment to an outpatient facility as opposed to an inpatient facility, the client has the right to be treated in the outpatient setting.
11. A client is considered legally competent unless the client has been declared incompetent through a legal hearing separate from the involuntary commitment hearing.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

12. In the course of providing nursing care and carrying out medical prescriptions, if the nurse believes that a client lacks competency to make informed decisions, action should be initiated to determine whether a legal guardian or substitute decision-maker needs to be appointed by the court.

D. Release from the hospital

1. Description
   - **a.** In some, but not all, jurisdictions, a client may be released voluntarily, against medical advice, or with conditions (conditional release). It is important to be familiar with the laws in the area in which you work regarding conditional release.
   - **b.** A client who has sought voluntary admission has the right to receive release upon request.
2. Voluntary release
   - **a.** In the absence of an act of self-harm or danger to others, a voluntary client should never be detained.
   - **b.** If a voluntary client wishes to be discharged from treatment, but is considered potentially dangerous to self or others, the PHCP can order the client to be detained while legal proceedings for involuntary status are sought. In other areas, the PHCP may place such a client on a 72-hour hold while further evaluation occurs.
   - **c.** Some states provide for conditional release of involuntarily hospitalized clients; this enables the treating PHCP to prescribe continued treatment on an outpatient basis as opposed to discharging clients to follow up on their own initiative. Community treatment orders may also be instituted, depending on the facility and on the area.
   - **d.** Conditional release usually involves outpatient treatment for a specified period to determine the client's adherence to medication protocol, ability to meet basic needs, and ability to reintegrate into the community.
   - **e.** An involuntary client who is released conditionally may be reinstitutionalized while the commitment is still in effect without recommencement of formal admission procedures.
3. Discharge planning and follow-up care
   - **a.** Discharge is the termination of the client–institution relationship.
   - **b.** The release may be prescribed by the psychiatrist, external board, or administration for involuntarily admitted clients and may be requested by voluntary clients at any time.
   - **c.** In most states, the client can institute an external board hearing to seek an expedient judicial discharge (writ of habeas corpus).
   - **d.** Discharge planning and follow-up care are important for the continued well-being of the client with a mental health problem.
   - **e.** Aftercare case managers are used to facilitate the client's adaptation back into the community and to provide early referral if the treatment plan is unsuccessful.
4. Procedures for mental health admissions and discharges may vary depending on state, province, and institution guidelines, policies, and procedures.

VIII. Types of Therapy for Care

A. Milieu therapy

1. The **milieu** refers to the safe physical and social environment in which an individual is receiving treatment.
2. Safety is the most important priority in managing the milieu, and all encounters with the client have the goal of being "therapeutic."
3. All members of the interprofessional health care team contribute to the planning and functioning of the milieu and are significant and valuable to the client's successful treatment outcomes; the team generally includes a registered nurse, social worker, exercise therapist, recreational therapist, psychologist, psychiatrist, occupational therapist, and clinical nurse specialist or nurse practitioner.
4. Community meetings, activity groups, social skills groups, and physical exercise programs are included to accomplish treatment goals.
5. One-to-one relationships are used to examine client behaviors, feelings, and interactions within the context of the therapeutic group activities.

The focus of milieu therapy is to empower clients through their involvement in setting their own goals and in developing purposeful relationships with the staff to assist in meeting these goals.

B. Interpersonal psychotherapy

1. A treatment modality that uses a therapeutic relationship to modify the client's feelings, attitudes, and behaviors and that works within an agreed-upon time frame to help meet the client's goals
2. Therapeutic communication forms the foundation of the therapist–client relationship, and this relationship is used as a way for the client to examine other relationships in life.
3. Supportive level of psychotherapy
   - **a.** Brief therapy or may extend over a period of years, allowing the client to express feelings, explore alternatives, and make decisions in a safe, caring environment

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

b. No plan exists to introduce new methods of coping; instead, the therapist reinforces the client's existing coping mechanisms.

4. Reeducative level of psychotherapy

a. The client explores alternatives in a planned, systematic way; this requires a longer period of therapy than supportive therapy.

b. The client agrees upon and specifies desired changes of behavior and learns new ways of perceiving and behaving.

c. Techniques may include short-term psychotherapy, reality therapy, cognitive restructuring, behavior modification, and development of coping skills.

5. Reconstructive level of psychotherapy

a. Emotional and cognitive restructuring of self takes place.

b. Positive outcomes include a greater understanding of self and others, more emotional freedom, and the development of potential abilities.

C. Behavior therapy

1. A treatment approach that uses the principles of Skinnerian (operant conditioning) or Pavlovian (classical conditioning) behavior theory to bring about behavioral change; the belief is that most behaviors are learned.

2. *Operant conditioning* refers to the manipulation of selected reinforcers to elicit and strengthen desired behavioral responses; the *reinforcer* refers to the consequence of the behavior, which is defined as anything that increases the occurrence of a behavior (Fig. 65.2).

3. In classical conditioning (respondent conditioning), the individual responds to a stimulus but is basically a passive agent (see Fig. 65.2).

4. Desensitization is a form of behavior therapy whereby exposure to increasing increments of a feared stimulus is paired with increasing levels of relaxation, which helps reduce the intensity of fear to a more tolerable level.

5. Aversion therapy is a form of behavior therapy whereby negative reinforcement is used to change behavior; for example, a stimulus attractive to the client is paired with an unpleasant event in hopes of endowing the stimulus with negative properties, thereby dissuading the behavior.

6. Modeling is behavioral therapy whereby the therapist acts as a role model for specific identified behaviors so that the client learns through imitation.

D. Cognitive therapy

1. An active, directive, time-limited, structured approach used to treat various mental health problems, including anxiety and depressive problems

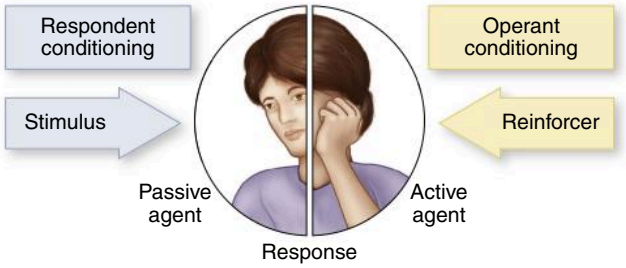

FIG. 65.2 Respondent versus operant conditioning.

2. It is based on the principle that how individuals feel and behave is determined by how they think about the world and their place in it; their cognitions are based on the attitudes or assumptions developed from previous experiences.

3. Therapeutic techniques are designed to identify, reality-test, and correct distorted conceptualizations and the dysfunctional beliefs underlying these cognitions.

4. The therapist helps individuals change the way they think, thereby reducing symptoms.

E. Group development and group therapy

1. Involves a leader such as a therapist, nurse, or other designated health care team member and, ideally, five to eight members working on their individual goals within the context of a group, which presumably increases the opportunity for feedback and support

2. Initial development of the group

a. Involves superficial rather than open and trusting communication

b. Members become acquainted with one another and search for similarities among themselves.

c. Members may be unclear about the purpose or goals of the group.

d. Group norms, roles, and responsibilities are established.

e. The work of termination begins and is expanded upon throughout the duration of the group.

3. Working in the group

a. The real work of the group is accomplished.

b. Members are familiar with one another, the group leader, and the group roles and feel free to address and attempt to solve their problems.

c. Both conflict and cooperation surface during the group's work as the members learn to work with one another.

4. Termination of the group

a. Begins with the initial meeting

b. Members' feelings are explored regarding their accomplishments and the impending termination of the group.

BOX 65.2 Self-Help and Support Groups

- Adult Children of Alcoholics
- Al-Anon
- Alcoholics Anonymous
- Bereavement groups
- Cancer support groups
- Co-Dependents Anonymous
- Gamblers Anonymous
- Groups to help deal with caring for family members
- Groups to help deal with unexpected body image changes, such as mastectomy or colostomy
- Mental health support groups
- Narcotics Anonymous
- Overeaters Anonymous
- Parents without Partners
- Recovery groups, such as for those who have experienced trauma
- Smoking-cessation groups

c. The termination stage provides an opportunity for members to learn to deal more realistically and comfortably with this normal part of human experience.

5. Self-help or support groups (Box 65.2)

⚠ Support groups are based on the premise that individuals who have experienced and are insightful concerning a problem are able to help others who have a similar problem.

F. Family therapy

1. Family therapy is a specific intervention mode based on the premise that the member with the presenting symptoms signals the presence of problems in the entire family; this premise also assumes that a change in one member will bring about changes in other members.
2. The therapist works to assist family members to identify and express their thoughts and feelings; define family roles and rules; try new, more productive styles of relating; and restore strength to the family.

PRACTICE QUESTIONS

1. A client with a diagnosis of depression who has attempted suicide says to the nurse, "I should have died. I've always been a failure. Nothing ever goes right for me." Which therapeutic response would the nurse make?
   1. "You have everything to live for."
   2. "Why do you see yourself as a failure?"
   3. "Feeling like this is all part of being depressed."
   4. "It sounds as if you've been feeling like a failure for a while."

2. The nurse visits a client at home. The client states, "I haven't slept at all the last couple of nights." Which therapeutic response would the nurse make?
   1. "Really?"
   2. "Why haven't you been able to sleep?"
   3. "Sometimes I have trouble sleeping too."
   4. "Tell me more about your sleep over the past few nights."

3. A client experiencing disturbed thought processes believes that the food is being poisoned. Which communication technique would the nurse use to encourage the client to eat?
   1. Using open-ended questions and silence
   2. Sharing personal preference regarding food choices
   3. Documenting reasons why the client does not want to eat
   4. Offering opinions about the necessity of adequate nutrition

4. The nurse would plan which goals for the termination stage of group development? **Select all that apply.**
   - ❑ 1. The group evaluates the experience.
   - ❑ 2. The real work of the group is accomplished.
   - ❑ 3. Group interaction involves superficial conversation.
   - ❑ 4. Group members become acquainted with one another.
   - ❑ 5. Some structuring of group norms, roles, and responsibilities takes place.
   - ❑ 6. The group explores members' feelings about the group and the impending separation.

5. A client diagnosed with terminal cancer says to the nurse, "I'm going to die, and I wish my family would stop hoping for a cure! I get so angry when they carry on like this. After all, I'm the one who's dying." Which response by the nurse is therapeutic?
   1. "Have you shared your feelings with your family?"
   2. "I think we should talk more about your anger with your family."
   3. "It sounds as if you are feeling angry that your family continues to hope for you to be cured."
   4. "You are probably very depressed, which is understandable with such a diagnosis."

6. On review of the client's record, the nurse notes that the admission was voluntary. Based on this information, the nurse plans care, anticipating which client behavior?
   1. Fearfulness regarding treatment measures
   2. Anger and aggressiveness directed toward others
   3. An understanding of the pathology and symptoms of the diagnosis
   4. A willingness to participate in the planning of the care and treatment plan

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. A client admitted voluntarily for treatment of an anxiety problem demands to be released from the hospital. Which action would the nurse take **initially**?
1. Contact the client's primary health care provider.
2. Call the client's family to arrange for transportation.
3. Attempt to persuade the client to stay "for only a few more days."
4. Tell the client that leaving would likely result in an involuntary commitment.

8. When reviewing the admission assessment, the nurse notes that a client was admitted to the mental health unit involuntarily. Based on this type of admission, the nurse would provide which intervention for this client?
1. Monitor closely for harm to self or others.
2. Assist in completing an application for admission.
3. Supply the client with written information about their mental health problem.
4. Provide an opportunity for family members to discuss why they felt the admission was needed.

9. When a client is admitted to an inpatient mental health unit with the diagnosis of anorexia nervosa, a cognitive behavioral approach is used as part of the treatment plan. The nurse plans care based on which purpose of this approach?
1. Providing a supportive environment
2. Examining intrapsychic conflicts and past issues
3. Emphasizing social interaction with clients who withdraw
4. Helping the client to examine dysfunctional thoughts and beliefs

10. A client is preparing to attend a Gamblers Anonymous meeting for the first time. The nurse would plan to tell the client that which is the first step in this 12-step program?
1. Admitting to having a problem
2. Substituting other activities for gambling
3. Stating that the gambling will be stopped
4. Discontinuing relationships with people who gamble

11. The nurse employed in a mental health clinic is greeted by a neighbor in a local grocery store. The neighbor says to the nurse, "How is Carol doing? Carol is my best friend and is seen at your clinic every week." Which is the **most appropriate** nursing response?
1. "I cannot discuss any client situation with you."
2. "If you want to know about Carol, you need to ask Carol yourself."
3. "Only because you're worried about a friend, I'll tell you that Carol is improving."
4. "Being a friend, you know that Carol is having a difficult time and deserves privacy."

12. The nurse calls security and has physical restraints applied to a client who was admitted voluntarily when the client becomes verbally abusive, demanding to be discharged from the hospital. Which represents the possible legal ramifications for the nurse associated with these interventions? **Select all that apply.**
- ❑ 1. Libel
- ❑ 2. Battery
- ❑ 3. Assault
- ❑ 4. Slander
- ❑ 5. False imprisonment

13. The nurse in the mental health unit plans to use which therapeutic communication techniques when communicating with a client? **Select all that apply.**
- ❑ 1. Restating
- ❑ 2. Active listening
- ❑ 3. Asking the client "Why?"
- ❑ 4. Maintaining neutral responses
- ❑ 5. Providing acknowledgment and feedback
- ❑ 6. Giving advice and approval or disapproval

14. What is the **most appropriate** nursing action to help manage a manic client who is monopolizing a group therapy session?
1. Ask the client to leave the group for this session only.
2. Refer the client to another group that includes other manic clients.
3. Tell the client to stop monopolizing in a firm but compassionate manner.
4. Thank the client for the input, but inform the client that others now need a chance to contribute.

15. A client is participating in a therapy group and focuses on viewing all team members as equally important in helping the clients meet their goals. The nurse is implementing which therapeutic approach?
1. Milieu therapy
2. Interpersonal therapy
3. Behavior modification
4. Support group therapy

16. The nurse is working with a client who, despite making a heroic effort, was unable to rescue a neighbor trapped in a house fire. Which client-focused action would the nurse plan to engage in during the working phase of the nurse–client relationship?
1. Exploring the client's ability to function
2. Exploring the client's potential for self-harm
3. Inquiring about the client's perception or appraisal of why the rescue was unsuccessful
4. Inquiring about and examining the client's feelings for any that may block adaptive coping

ANSWERS

1. *Answer:* 4

Rationale: Responding to the feelings expressed by a client is an effective therapeutic communication technique. The correct option is an example of the use of restating. The remaining options block communication because they minimize the client's experience and do not facilitate exploration of the client's expressed feelings. In addition, use of the word *why* is nontherapeutic because clients frequently interpret *why* questions as accusations. *Why* questions can cause resentment, insecurity and mistrust.

Test-Taking Strategy: Use therapeutic communication techniques to direct you to the option that directly addresses the client's feelings and concerns. Also, the correct option is the only one stated in the form of a question that is open-ended, which will encourage the verbalization of feelings.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 94-95, 366.

2. *Answer:* 4

Rationale: The correct option uses the therapeutic communication technique of exploring. Exploring is an important technique to use in examining experiences that are important to the client. The remaining options are nontherapeutic responses and are blocks to communication. Additionally, they do not encourage the client to expand on the problem. The response "Really?" can be interpreted by the client that the nurse is doubtful of what the client has expressed. Use of the word *why* is nontherapeutic because it may be interpreted as accusatory and can cause insecurity and mistrust. Offering personal experiences moves the focus away from the client and onto the nurse.

Test-Taking Strategy: Use therapeutic communication techniques. "Really?" is a response that may make clients feel that they are not believed. Use of the word *why* is nontherapeutic because it may be interpreted as accusatory. Providing personal experiences focuses on the nurse's problem and thus minimizes the client's concerns. The correct option will provide information about the perception of the problem from the client's perspective.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93-95.

3. *Answer:* 1

Rationale: Open-ended questions and silence are strategies used to encourage clients to discuss their problems. Sharing personal food preferences is not a client-centered intervention. The remaining options are not helpful to the client because they do not encourage the client to express feelings. The nurse would not offer opinions and should encourage the client to identify the reasons for the behavior.

Test-Taking Strategy: Use therapeutic communication techniques. First, eliminate options that do not support the client's expression of feelings. Any option that is not client-centered should be eliminated next. Focusing on the client's feelings will direct you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93, 234-235.

4. *Answer:* 1, 6

Rationale: The stages of group development include the initial stage, the working stage, and the termination stage. During the initial stage, the group members become acquainted with one another, and some structuring of group norms, roles, and responsibilities takes place. During the initial stage, group interaction involves superficial conversation. During the working stage, the real work of the group is accomplished. During the termination stage, the group evaluates the experience and explores members' feelings about the group and the impending separation.

Test-Taking Strategy: Focus on the subject, the termination stage. Reading each item presented and recalling the stages of group development and the definition of termination will assist you in answering this question.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 111-112.

5. *Answer:* 3

Rationale: Restating is a therapeutic communication technique in which the nurse repeats what the client says to show understanding and to review what was said. Although it is appropriate for the nurse to attempt to assess the client's ability to discuss feelings openly with family members, it does not help the client discuss the feelings causing the anger. The nurse's direct attempt to expect the client to talk more about the anger is premature. The nurse would never make a judgment regarding the reason for the client's feeling; this is nontherapeutic in the one-to-one relationship.

Test-Taking Strategy: Use therapeutic communication techniques. The correct option is the only one that identifies the use of a therapeutic technique (restatement) and focuses on the client's feelings.

References: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 263; Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93-95.

6. *Answer:* 4

Rationale: In general, clients seek voluntary admission. If a client seeks voluntary admission, the most likely expectation is that the client will participate in the treatment program since the client is actively seeking help. The remaining options are not characteristics of this type of admission. Fearfulness, anger, and aggressiveness are more characteristic of an involuntary admission. Voluntary admission does not guarantee that clients understand their mental health problems; it only indicates the client's desire for help.

Test-Taking Strategy: Focus on the subject, voluntary admission. This should direct you to the correct option. Note the relationship between the word *voluntary* and the correct option.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Reference: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. p. 145.

7. *Answer:* 1

Rationale: In general, clients seek voluntary admission. Voluntary clients have the right to demand and obtain release, unless they pose an immediate danger to themselves or others, in which case the admission could become involuntary, depending on the circumstances and regulations in that area and facility. The nurse needs to be familiar with the state and facility policies and procedures. The initial nursing action is to contact the PHCP, who has the authority to discuss discharge with the client. While arranging for safe transportation is appropriate, it is premature in this situation and would be done only with the client's permission. While it is appropriate to discuss why the client feels the need to leave and the possible outcomes of leaving against medical advice, attempting to get the client to agree to staying "for only a few more days" has little value and is unlikely to be successful. Many states require that the client submit a written release notice to the facility psychiatrist, who reevaluates the client's condition for possible conversion to involuntary status if necessary, according to criteria established by law. While this is a possibility, it would not be used as a threat with the client.

Test-Taking Strategy: Note the **strategic word,** *initially.* Noting the type of hospital admission will assist in directing you to the correct option while eliminating those that are unlikely to occur. Calling the family should be eliminated, based on the issues of client rights and confidentiality. To "persuade" a client to stay in the hospital is inappropriate. Threatening the client is inappropriate and illegal.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 62.

8. *Answer:* 1

Rationale: Involuntary admission is necessary when a person is a danger to self or others or is in need of psychiatric treatment regardless of the client's willingness to consent to the hospitalization. A written request is a component of a voluntary admission. Providing written information regarding the mental health problem is probably premature initially. The family may have had no role to play in the client's admission.

Test-Taking Strategy: Focus on the **subject,** involuntary admission. Use **Maslow's Hierarchy of Needs theory.** Safety is the priority if a physiological need does not exist. This should direct you to the correct option. Also, note that the remaining options are not always true of an involuntary admission.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 62-63.

9. *Answer:* 4

Rationale: Cognitive behavioral therapy is used to help the client identify and examine dysfunctional thoughts and to identify and examine values and beliefs that maintain these thoughts. The remaining options, while therapeutic in certain situations, are not the focus of cognitive behavioral therapy.

Test-Taking Strategy: Focus on the **subject,** the purpose of a cognitive behavioral approach. Note the relationship between the word *cognitive* in the question and *thoughts* in the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 24, 190.

10. *Answer:* 1

Rationale: The first step in the 12-step program is to admit that a problem exists. Substituting other activities for gambling may be a strategy, but it is not the first step. The remaining options are not realistic strategies for the initial step in a 12-step program.

Test-Taking Strategy: Focus on the **subject,** the first step in the 12-step program. This will assist in directing you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 425-426.

11. *Answer:* 1

Rationale: The nurse is required to maintain confidentiality regarding the client and the client's care. Confidentiality is basic to the therapeutic relationship and is a client's right. The most appropriate response to the neighbor is the statement of that responsibility in a direct, but polite manner. A blunt statement that does not acknowledge why the nurse cannot reveal client information may be taken as disrespectful and uncaring. The remaining options identify statements that do not maintain client confidentiality.

Test-Taking Strategy: Note the **strategic words,** *most appropriate.* Focusing on maintaining confidentiality will direct you to the correct option. This focus will also assist you in eliminating options that inappropriately give such information without being unnecessarily blunt or rude.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 65-66, 111.

12. *Answer:* 2, 3, 5

Rationale: False imprisonment is an act with the intent to confine a person to a specific area. The nurse can be charged with false imprisonment if the nurse prohibits a client from leaving the hospital if the client has been admitted voluntarily and if no agency or legal policies exist for detaining the client. Assault and battery are related to the act of restraining the client in a situation that did not meet criteria for such an intervention. Libel and slander are not applicable here since the nurse did not write or verbally make untrue statements about the client.

Test-Taking Strategy: Focus on the **subject,** legal ramifications of nursing actions related to hospital admission. Noting the words *admitted voluntarily* will assist you in selecting the options related to inappropriately preventing the client from leaving the hospital, a right to which a voluntarily committed client is entitled. The remaining options do not relate to acts that prevent the client from leaving the hospital.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 67, 69.

13. *Answer:* 1, 2, 4, 5

Rationale: Therapeutic communication techniques include listening, maintaining silence, maintaining neutral responses, using broad openings and open-ended questions, focusing and refocusing, restating, clarifying and validating, sharing perceptions, reflecting, providing acknowledgment and feedback, giving information, presenting reality, encouraging formulation of a plan of action, providing nonverbal encouragement, and summarizing. Asking "why" is often interpreted by the client as being accusatory and would also be avoided. Providing advice and giving approval or disapproval are barriers to communication.

Test-Taking Strategy: Use **therapeutic communication techniques.** This will assist you in both selecting the correct answers and eliminating the examples of nontherapeutic communication.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 94-95, 98.

14. *Answer:* 4

Rationale: If a client is monopolizing the group, the nurse must be direct and decisive. The best action is to thank the client and suggest that the client stop talking and try listening to others. Although telling the client to stop monopolizing in a firm but compassionate manner may be a direct response, the correct option is more specific and provides direction for the client. The remaining options are inappropriate because they are not directed toward helping the client in a therapeutic manner.

Test-Taking Strategy: Note the **strategic words,** *most appropriate.* Use **therapeutic communication techniques** to assist in directing you to the correct option. Note that the correct option is specific and provides direction for the client.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 29-30, 93.

15. *Answer:* 1

Rationale: All treatment team members are viewed as significant and valuable to the client's successful treatment outcomes in milieu therapy. Interpersonal therapy is based on a one-to-one or group therapy approach in which the therapist–client relationship is often used as a way for clients to examine other relationships in their lives. Behavior modification is based on rewards and punishment. Support groups are based on the premise that individuals who have experienced and are insightful concerning a problem are able to help others who have a similar problem.

Test-Taking Strategy: Focus on the **subject,** characteristics of a type of therapy. Note the relationship between the words *helping the clients meet their goals* and the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 84.

16. *Answer:* 4

Rationale: The client must first deal with feelings and negative responses before the client can work through the meaning of the crisis. The correct option pertains directly to the client's feelings and is client-focused. The remaining options do not directly focus on or address the client's feelings.

Test-Taking Strategy: Focus on the **subject,** the working phase of the nurse–client relationship. Also, note the words *client-focused action.* Think about the interventions that occur in this phase. Select the option that focuses on the feelings of the client.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 333-334.

CHAPTER 66

Mental Health Problems

Contributor: Michael Johnson, PhD, RN, PMH-BC, CNE

PRIORITY CONCEPTS **Mood and Affect; Safety**

I. Anxiety

A. Description
- **1.** A normal response to stress
- **2.** A subjective experience that includes feelings of apprehension, uneasiness, uncertainty, or dread
- **3.** Occurs as a result of a threat that may be misperceived or misinterpreted, or a threat to identity or self-esteem
- **4.** Anxiety may result when values are threatened or preceding new experiences.

B. Types of anxiety
- **1.** Normal: A healthy type of anxiety
- **2.** Acute: Precipitated by imminent loss or change that threatens one's sense of security
- **3.** Pathological: Occurs when the intensity of the emotional response is out of proportion to the threat, the emotional response persists after the threat is resolved, or the emotional response becomes generalized to benign situations

C. Levels of anxiety
- **1.** Mild
  - **a.** Mild anxiety is associated with tense experiences that occur in everyday life.
  - **b.** Increased ability to grasp information
  - **c.** Sense of sight and sound are increased.
  - **d.** Perceptual field is increased.
  - **e.** Can be motivating, produce growth, enhance creativity, and increase learning
  - **f.** Physical symptoms may include restlessness, irritability, or mild tension.
- **2.** Moderate
  - **a.** The focus is on immediate concerns.
  - **b.** Narrowed perceptual field
  - **c.** Senses of sight and sound diminish as selective inattentiveness occurs.
  - **d.** Learning and problem-solving still occur.
  - **e.** Physical symptoms include increased heart rate, perspiration, gastric discomfort, headache, urinary urgency, and/or mild tremors.
- **3.** Severe
  - **a.** Severe anxiety is a feeling that something bad is about to happen.
  - **b.** A significant narrowing in the perceptual field occurs.
  - **c.** Focus is on minute or scattered details.
  - **d.** All behavior is aimed at relieving the anxiety.
  - **e.** Learning and problem-solving are not possible.
  - **f.** Actions are aimed at reducing or alleviating anxiety.
  - **g.** Physical symptoms are caused by stimulation of the sympathetic nervous system (e.g., headache, nausea, dizziness, sleep disturbances), increased tremors, pounding heart rate, and hyperventilation.
  - **h.** The individual needs direction to focus.
- **4.** Panic
  - **a.** Associated with dread and terror and a sense of impending doom
  - **b.** Disorganization, difficulty perceiving reality, and inability to concentrate
  - **c.** Loss of rational thoughts with distorted perception occurs.
  - **d.** The individual is unable to communicate or function effectively.
  - **e.** If prolonged, panic can lead to exhaustion and death.
  - **f.** Increased motor activity (pacing, shouting, screaming) or withdrawal
  - **g.** Impulsive and erratic behavior

D. Interventions: General nursing measures (see Clinical Judgment: Take Action box)

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

CLINICAL JUDGMENT: TAKE ACTION

The nurse working at a mental health care facility is assisting a client with managing an acute anxiety attack, and takes the following actions to ensure safety:

- Provides a calm environment, decreases environmental stimuli, and stays with the client
- Asks the client to identify what and how they feel
- Encourages the client to describe and discuss their feelings
- Helps the client identify the causes of the feelings if they are having difficulty in doing so
- Listens to the client for expressions of helplessness and hopelessness
- Documents the event, significant information, actions taken and follow-up actions, and the client's response

BOX 66.1 Criteria for General Anxiety Disorder

- Excessive anxiety and worry about several events or activities for more than 6 months
- Inability to cope with anxiety
- Anxiety associated with three (or more) of the following symptoms for more than 6 months:
  1. Feeling restless or on edge
  2. Easily tired
  3. Poor attention span
  4. Irritability
  5. Muscle tension
  6. Difficulty sleeping (insomnia, difficulty falling or staying asleep)
- Anxiety causes significant distress or impaired ability to work or to maintain relationships.
- No concurrent substance use or misuse
- No underlying medical cause
- Not explained by another mental health problem

Varcarolis, E. & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 143.

1. Recognize the anxiety.
2. Establish trust.
3. Protect the client.
4. Modify the environment by setting limits or limiting interaction with others.
5. Do not criticize coping mechanisms.
6. Provide creative outlets.
7. Monitor for signs of impending destructive behavior.
8. Promote relaxation techniques, such as breathing exercises or guided imagery.
9. Monitor vital signs, and administer antianxiety medications as prescribed.
10. Do not force the client into situations that provoke anxiety.

The immediate nursing action for a client with anxiety is to decrease stimuli in the environment and provide a calm and quiet environment.

E. Interventions: Mild to moderate levels
1. Help the client identify the source of their anxiety.
2. Encourage the client to talk about feelings and concerns.
3. Help the client identify thoughts and feelings that occurred before the onset of anxiety.
4. Encourage problem-solving.
5. Encourage gross motor exercise.

F. Interventions: Severe to panic levels
1. Use a calm manner.
2. Always remain with the client.
3. Minimize environmental stimuli.
4. Provide clear, simple statements.
5. Use a low-pitched voice.
6. Attend to the physical needs of the client.
7. Provide gross motor activity (walk/pace with nurse).
8. Assess need for and administer antianxiety medications as prescribed.
9. Ensure safety.

II. Generalized Anxiety Disorder

A. Description (Box 66.1)
1. Generalized anxiety disorder is an unrealistic anxiety about everyday worries that persists more days than not, over at least 6 months, and is not associated with another mental health or medical problem.
2. Physical symptoms occur.

B. Assessment
1. Restlessness and inability to relax
2. Episodes of trembling and shakiness
3. Chronic muscular tension
4. Dizziness
5. Inability to concentrate
6. Chronic fatigue and sleep problems
7. Inability to recognize the connection between the anxiety and physical symptoms
8. Client is focused on the physical discomfort.

C. Unexpected and expected panic attacks
1. Description
   - **a.** Most extreme level of anxiety, resulting in disturbed behavior
   - **b.** Produces a sudden onset of feelings of intense apprehension and dread
   - **c.** Cause usually cannot be identified.
   - **d.** Severe, recurrent, intermittent anxiety attacks lasting 5 to 30 minutes occur.
2. Assessment
   - **a.** Choking sensation
   - **b.** Labored breathing
   - **c.** Pounding heart
   - **d.** Chest pain

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

e. Dizziness
f. Nausea
g. Blurred vision
h. Numbness or tingling of the extremities
i. Sense of unreality and helplessness
j. Fear of being trapped
k. Fear of dying

3. Interventions
   a. Remain with the client.
   b. Attend to physical symptoms.
   c. Assist the client to identify the thoughts that aroused the anxiety and identify the basis for these thoughts.
   d. Assist the client to change the unrealistic thoughts to more realistic thoughts.
   e. Use cognitive restructuring to replace distorted thinking.
   f. Administer antianxiety medications if prescribed.

III. Post-traumatic Stress Disorder (PTSD)

A. Description: After experiencing a psychologically traumatic event, the individual is prone to reexperience the event and have recurrent and intrusive dreams or flashbacks.

B. Possible causes
1. Natural disaster
2. Terrorist attack
3. Combat experiences
4. Accidents
5. Rape
6. Crime or violence
7. Sexual, physical, or emotional **abuse**

C. Symptoms
1. Intrusive reexperiencing of the initial trauma (flashbacks, recurrent nightmares, unwanted distressing memories, strong emotional responses when reminded of the traumatic event)
2. Avoiding anything that might cause recall of the event
3. Alteration in arousal (increased irritability, angry outbursts, exaggerated startle response, sleeping difficulties, and hypervigilance)
4. Excessive fear, guilt, and feelings of detachment

D. Assessment
1. Avoidance or numbness
2. Irritability or outbursts of anger
3. Detachment
4. **Depression** that may involve suicidal thoughts
5. Anxiety
6. Sleep disturbances and nightmares
7. Flashbacks of event
8. Hypervigilance and exaggerated startle response
9. Guilt about surviving the event
10. Poor concentration and avoidance of activities that trigger the memory of the event

E. Interventions during flashbacks
1. Assess client's level of functioning.
2. Ensure safety of client and others around them (risk for **suicide** and potential harm toward others).
3. Establish therapeutic alliance.
4. Ensure physical and psychological safety (reinforce to client that they are safe).
5. Remain calm and supportive.
6. Do not startle the client.

F. General interventions for clients with PTSD
1. Be nonjudgmental and supportive.
2. Assure the client that their feelings are normal reactions.
3. Encourage the client to express their feelings.
4. Monitor for suicidal risk.
5. Teach stress management techniques.
6. Assist the client in identifying and developing adaptive coping and relaxation techniques.
7. Encourage the use of support groups.
8. Include the family in treatment.
9. Educate the client about evidence-based therapeutic interventions, such as medications, cognitive behavioral therapy, prolonged exposure therapy, and eye movement desensitization and reprocessing (EMDR).

G. Trauma-informed care
1. Framework developed by the National Center for Trauma-Informed Care and recognized by the American Nurses Association, National Academy of Medicine, and Quality and Safety Education for Nurses
2. Provides guidelines for integrating an understanding of how trauma affects clients
3. Main concept is a change in paradigm from one that asks "What's wrong with you?" to one that asks "Tell me what has happened to you?"
4. Principles of trauma-informed care include: (a) avoiding retraumatizing through restraints or coercive practices, (b) an open and collaborative relationship between client and clinician/provider, (c) peer support, (d) empowerment, voice and choice, and (e) cultural respect.

> ⚠ Clients dealing with cancer may develop post-traumatic stress (PTS). Cancer-related PTS can occur anytime during or after treatment. The symptoms of PTS are similar to those of post-traumatic stress disorder but are generally less severe.

IV. Moral Injury

A. Description
1. Occurs as a result of actions, the witnessing of behaviors, or a failure to prevent behaviors that are in conflict with one's deeply held values and moral beliefs

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Moral injury is not currently considered a mental health problem; it has similarities and differences when compared to PTSD.
3. Moral injury is similar to PTSD in that both begin with an event that is harmful to self or others and is often life-threatening. Other similarities include guilt, shame, betrayal, and loss of trust that occurs.
4. Hyperarousal and a fear-based reaction that occurs in PTSD is not characteristic of moral injury; in addition, it is possible to have moral injury and not meet the criteria for PTSD.
5. Most research on moral injury has been with service members and veterans because of their exposure to war and combat situations.
6. Other research on moral injury has been among health care workers, including the effects of a health care **crisis**, such as COVID-19. For additional information, refer to: Watson, P., Norman, S., Maguen, S., & Hamblen J. (2020). Moral injury in health care workers, U.S. Department of Veterans Affairs, at https://www.ptsd.va.gov/professional/treat/cooccurring/moral_injury_hcw.asp

B. Assessment
1. Assess for depression and self-injurious behaviors as a priority.
2. Guilt: The person feels as though they did something bad.
3. Shame: The person believes they are bad because of what they did.
4. Disgust: When the person recalls memories of the act
5. Anger: As a response to a loss or betrayal
6. Inability to self-forgive for the act, witnessing the act, or failing to prevent the act

C. Interventions
1. An accepting, nonjudgmental approach is important because the person may be concerned about a nurse's or therapist's reaction, and sometimes the person may feel as though they don't deserve to feel better; assess the client for these self-beliefs.
2. Goals include to build resilience, manage stress, and improve well-being.
3. Assess for depression and self-injurious behaviors.
4. Self-report questionnaires to assess moral injury in war-related experiences may be useful for certain clients.
5. It may be difficult for an individual to share morally injurious acts because of their guilt, shame, and disgust; one-on-one therapy may be a safe environment initially, but the treatment plan should be decided by the client.
6. Group therapy may be helpful because individuals who have experienced similar injuries can share and communicate their emotions and pain.
7. Cognitive processing therapy may assist with addressing beliefs about self and working through beliefs that may underlie the guilt, shame, or betrayal, such as doing something differently during the trauma.
8. Other therapies being researched include Acceptance and Commitment Therapy, Adaptive Disclosure, Impact of Killing Intervention, Trauma-Informed Guilt Reduction, and Building Spiritual Strength.

V. Specific Phobia

A. Description
1. Irrational fear of an object, activity, or situation that persists and that leads to avoidance
2. Associated with panic-level anxiety or fear if the object, situation, or activity cannot be avoided
3. **Defense mechanisms** commonly used include repression and displacement.

B. Types (Box 66.2)

C. Interventions
1. Identify the basis of the anxiety.
2. Allow the client to verbalize feelings about the anxiety-producing object or situation; talking frequently about the feared object is the first step in the desensitization process.
3. Teach relaxation techniques, such as breathing exercises, muscle relaxation exercises, and visualization of pleasant situations.
4. Promote desensitization by gradually introducing the individual to the feared object or situation in small doses.

⚠ Always stay with the client who is experiencing anxiety to promote safety and security. Never force the client to have contact with the phobic object or situation.

BOX 66.2 Some Types of Phobias

Acrophobia: Fear of heights
Agoraphobia: Fear of open spaces
Astraphobia: Fear of electrical storms
Claustrophobia: Fear of closed spaces
Hematophobia: Fear of blood
Hydrophobia: Fear of water
Monophobia: Fear of being alone
Mysophobia: Fear of dirt or germs
Nyctophobia: Fear of darkness
Pyrophobia: Fear of fires
Social Phobia: Fear of situations in which one might be embarrassed or criticized; fear of making a fool of oneself
Xenophobia: Fear of strangers
Zoophobia: Fear of animals

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

VI. Obsessive-Compulsive and Related Disorders

A. Obsessions: Preoccupation with persistently intrusive thoughts, impulses, or images and ideas

B. Compulsions: The performance of rituals or repetitive behaviors an individual is driven to perform to prevent some event, divert unacceptable thoughts, and decrease anxiety

1. Obsessions and compulsions often occur together and can disrupt normal daily activities.
2. Anxiety occurs when one resists obsessions or compulsions and from being powerless to resist the thoughts or rituals.
3. Obsessive thoughts can involve issues of violence, aggression, sexual behavior, orderliness, or religion and uncontrollably can interrupt conscious thoughts and the ability to function.

C. Compulsive behavior patterns (behaviors or rituals)

1. Compulsive behavior patterns decrease the anxiety.
2. The patterns are associated with the obsessive thoughts.
3. The patterns neutralize the thought.
4. During stressful times, the ritualistic behavior increases.
5. Defense mechanisms include repression, displacement, and undoing.

D. Related disorders

1. Hoarding disorder
2. Excoriation (skin-picking) disorder
3. Substance- or medication-induced obsessive-compulsive and related disorder
4. Obsessive-compulsive and related disorder due to another medical condition
5. Trichotillomania (hair-pulling disorder)

E. Interventions (Box 66.3)

BOX 66.3 Interventions for Obsessive-Compulsive Disorder

- Ensure that basic needs (food, rest, hygiene) are met.
- Identify situations that precipitate compulsive behavior; encourage the client to verbalize concerns and feelings.
- Be empathetic toward the client and aware of their need to perform the compulsive behavior.
- Do not interrupt compulsive behaviors unless they jeopardize the safety of the client or others (provide for client safety related to the behavior).
- Allow time for the client to perform the compulsive behavior, but set limits on behaviors that may interfere with the client's physical well-being to protect the client from physical harm.
- Implement a schedule for the client that distracts from the behaviors (structure simple activities, games, or tasks for the client).
- Establish a written contract that assists the client to decrease the frequency of compulsive behaviors gradually.
- Recognize and reinforce positive nonritualistic behaviors.

VII. Somatic Symptom and Related Disorders

A. Description

1. Somatic symptom disorders are characterized by a combination of persistent worry or complaints and an associated maladaptive response regarding physical illness without supportive physical findings and medical diagnosis.
2. The client focuses on the physical signs and symptoms and is unable to control the signs and symptoms.
3. The physical signs and symptoms increase with psychosocial stressors and result in a high level of functional impairment.
4. The anxiety is redirected into a somatic concern.
5. The client may unconsciously somatize for secondary gains, such as increased attention and decreased responsibilities.

B. Conversion disorder (functional neurological symptom disorder)

1. Description
   - **a.** The sudden onset of a neurological symptom or a deficit in the absence of a neurological cause or diagnosis
   - **b.** Conversion disorder is an expression of a psychological conflict or need.
   - **c.** The most common conversion symptoms are blindness, deafness, numbness, paralysis, gait disturbance, and the inability to talk.
   - **d.** Conversion disorder has no organic cause.
   - **e.** Symptoms are beyond the conscious control of the client and are directly related to conflict.
   - **f.** The development of physical symptoms reduces anxiety.
2. Assessment
   - **a.** Rule out a physiological cause for symptoms or deficits.
   - **b.** "*La belle indifference*": Unconcerned with symptoms
   - **c.** Physical limitation or disability
   - **d.** Feelings of guilt, anxiety, or frustration
   - **e.** Low self-esteem and feelings of inadequacy
   - **f.** Unexpressed anger or conflict
   - **g.** Secondary gain
   - **h.** History of physical or sexual abuse

C. Interventions

1. Obtain a nursing history and assess for physical problems.
2. Explore the needs being met by the physical symptoms with the client.
3. Assist the client to identify alternative ways of meeting needs.
4. Assist the client to relate feelings and conflicts to the physical symptoms.
5. Convey understanding that the physical symptoms are real to the client.
6. Assure the client that physical illness has been ruled out.
7. Report and assess any new physical complaint.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

8. Use a pain assessment scale if the client complains of pain, and implement pain reduction measures as required.
9. Explore the source of anxiety and stimulate verbalization of anxiety.
10. Assist the client in recognizing personal feelings and emotions.
11. Encourage the use of relaxation techniques as the anxiety increases.
12. Encourage diversional activities.
13. Provide positive feedback.
14. Administer antianxiety medications if prescribed.

⚠ For a client with a somatic symptom disorder, allow a specific time period for the client to discuss physical complaints, because the client will feel less threatened if this behavior is limited rather than stopped completely. Avoid responding with positive reinforcement about the physical complaints.

VIII. Dissociative Disorder

A. Description
1. Dissociative disorder is a disruption in integrative functions of memory, consciousness, or identity.
2. It is associated with exposure to an extremely traumatic event.

B. Dissociative identity disorder (DID), formerly called *multiple personality disorder*
1. Description
   - **a.** Two or more fully developed, distinct, and unique personalities exist within the client and recurrently control behavior.
   - **b.** The host is the primary personality, and the other personalities are referred to as *alters.*
   - **c.** Alter personalities may take full control of the client, one at a time, and may or may not be aware of one another.
   - **d.** The alters may be aware of the host, but the host is not usually aware of the alters.
2. Assessment
   - **a.** The client may have an inability to recall important information (unrelated to ordinary forgetfulness).
   - **b.** Transition from one personality to another is related to stress or a traumatic event and is sudden.
   - **c.** Dissociation is used as a method of distancing and defending one's self from anxiety and traumatizing experiences.
3. Common assessment questions when DID is suspected (Box 64.4)

C. Dissociative amnesia
1. Description
   - **a.** Inability to recall important personal information, often due to trauma or because the information provokes anxiety

BOX 66.4 Assessment Questions when Dissociative Identity Disorder is Suspected

- Have you ever found yourself wearing clothes you cannot remember buying?
- Have you ever had strange persons greet and talk to you as thought they were old friends?
- Does your ability to engage in things such as athletics, artistic activities, or mechanical tasks seem to change?
- Do you have differing sets of memories about childhood?

   - **b.** Memory impairment may range from partial to almost complete.
   - **c.** The client may assume a new identity in a new environment, drift from place to place, develop a few relationships, and then return home unable to remember the amnesia.
2. Assessment
   - **a.** Localized: The client blocks out all memories about a specified period.
   - **b.** Selective: The client recalls some but not all memories about a specified period.
   - **c.** Generalized: The client has a loss of all memory about past life.

D. Depersonalization/derealization disorder
1. Description: An altered self-perception in which one's own reality is temporarily lost or changed
2. Assessment
   - **a.** Feelings of detachment
   - **b.** Intact reality testing

E. Interventions
1. Orient the client.
2. Develop a trusting relationship with the client.
3. Encourage verbal expression of painful experiences, anxieties, and concerns.
4. Explore methods of coping.
5. Identify sources of conflict.
6. Focus on the client's strengths and skills.
7. Provide nondemanding, simple routines.
8. Allow the client to progress at their own pace.
9. Implement stress reduction techniques.
10. Plan for individual, group, or family psychotherapy to integrate dissociated aspects of personality or memory and to expand self-awareness.

IX. Mood Disorders

A. Bipolar and related disorders
1. Description (Box 66.5)
   - **a.** Bipolar disorder is characterized by extreme changes in mood, energy, and the ability to function.
   - **b.** The classifications include bipolar I disorder, bipolar II disorder, cyclothymic disorder, and mixed features.
   - **c.** Bipolar I disorder: Most severe form, characterized by severe mood episodes from mania to depression

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.5 Assessment of Bipolar and Related Disorders

Mania

- Unpredictable and labile mood
- Delusional self-confidence
- Constantly pushing limits, manipulating, and finding fault
- Euphoric with intense feelings of well-being
- Demonstrates little or no inhibition
- Distracted by environmental stimuli
- Extroverted personality
- Flight of ideas
- Grandiose and persecutory delusions
- High and unstable affect
- Significant decrease in appetite
- Inability to eat or sleep because of involvement in more important things
- Unlimited energy
- Inappropriate affect
- Dress that is inappropriately bizarre, loud, and/or colorful
- Makeup is colorful and overdone
- Excessive spending
- Pressured and/or clanging speech
- Restlessness
- Sexually promiscuous
- Urgent motor activity

Depression

- Increased or decreased appetite
- Decrease in activities of daily living
- Decreased emotion and physical activity
- Easily fatigued
- Inability to make decisions
- Poor concentration
- Internalizing hostility
- Introverted personality
- Social isolation and withdrawn from groups
- Lack of energy
- Lack of initiative
- Lack of self-confidence and low self-esteem
- Lack of sexual interest
- Psychomotor retardation
- Suicidal thinking

d. Bipolar II disorder: A milder form of mood elevation; there are milder episodes of hypomania that alternate with periods of severe depression.

e. Cyclothymic disorder: Brief periods of hypomanic symptoms occur, alternating with brief periods of depressive symptoms that are not as extensive or as long-lasting as seen in full hypomanic episodes or full depressive episodes.

f. Mixed features: The occurrence of simultaneous symptoms of opposite mood polarities during manic, hypomanic, or depressive episodes. Its features are high energy, sleeplessness, and racing thoughts. At the same time, the individual may feel hopeless, despairing, irritable, and suicidal.

g. The medication of choice has traditionally been lithium carbonate, which can be toxic and requires regular monitoring of serum lithium levels to help keep the medication's therapeutic index level appropriate; a stable intake of adequate dietary sodium and fluid (2 to 3 L daily) must be maintained to avoid toxicity.

h. Other medications may be prescribed, both to reduce the symptoms of acute bipolar manic episodes and for maintenance therapy.

i. Antianxiety agents may be prescribed to assist in managing the psychomotor agitation characteristic of mania; these medications should be avoided in clients with a history of substance abuse.

j. Atypical antipsychotic medications may be prescribed for both their sedative and mood-stabilizing effects.

2. Assessment

a. Assess and monitor whether the client is a danger to self or others.

b. Assess for alcohol or substance use/misuse.

c. Mood

d. Behavior

e. Speech (flight of ideas, tangential)

f. Cognitive functioning

g. Inflated self-regard (delusions of grandeur)

h. Sleeping pattern

i. Impulse control

3. Interventions for mania (Box 66.6)

a. Remove hazardous objects from the environment (this should be done for all clients).

b. Assess the client closely for fatigue.

c. Provide frequent rest periods and monitor the client's sleep patterns; use comfort measures to promote sleep.

d. Provide a private room if possible.

e. Encourage the client to ventilate feelings.

f. Use calm, slow interactions.

g. Help the client focus on one topic during the conversation.

h. Ignore or distract the client from grandiose thinking; present reality to the client.

i. Do not argue with the client.

j. Limit group activities, and assess the client's tolerance level; solitary activities may be necessary.

k. Provide high-calorie finger foods and fluids.

l. Reduce environmental stimuli.

m. Set limits on inappropriate behaviors.

n. Provide physical activities and outlets for tension.

o. Avoid competitive games.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.6 Dealing with Inappropriate Behaviors Associated with Bipolar Disorder

Aggressive Behavior

- Assist the client in identifying feelings of frustration and aggression.
- Encourage the client to talk out instead of acting out feelings of frustration.
- Assist the client in identifying precipitating events or situations that lead to aggressive behavior.
- Describe the consequences of the behavior for self and others.
- Assist the client in identifying previous coping mechanisms.
- Assist the client in problem-solving techniques to cope with frustration or aggression.

De-escalation Techniques

- Maintain safety for the client, other clients, and self.
- Respect personal space, and use a nonaggressive posture.
- Establish verbal contact.
- Use a calm approach and communicate with a calm, clear tone of voice (be assertive, not aggressive).
- Be concise.
- Determine what the client considers to be personal wants and feelings.
- Listen closely to what the client is saying.
- Avoid verbal struggles; agree or agree to disagree.
- Provide the client with clear options that deal with the client's behavior.
- Offer choices and optimism.
- Assist the client with problem-solving and decision-making regarding options.
- Debrief the client and staff.

Manipulative Behavior

- Set clear, consistent, realistic, and enforceable limits, and communicate expected behaviors.
- Be clear about consequences associated with exceeding set limits; follow through with consequences in a nonpunitive manner, if necessary.
- Discuss the client's behavior in a nonjudgmental and nonthreatening manner.
- Avoid power struggles with the client (avoid arguing with the client).
- Assist the client in developing means of setting limits on own behavior.

p. Provide gross motor activities such as walking.
q. Provide structured activities or one-to-one activities with the nurse.
r. Provide simple and direct explanations for routine procedures.
s. Supervise the administration of medication.

B. Depression: See Section X.

X. Depressive Disorders

A. Description
1. Depression affects feelings, thoughts, and behaviors.
2. Depression is one of the most common psychiatric disorders.
3. Risk factors include genetic predisposition, dysregulation of serotonin and/or norepinephrine, inflammatory processes, stressful or traumatic life events, and various psychological factors.
4. There are many different psychiatric diagnoses for clients who exhibit depressive symptoms, but the most common one is major depressive disorder.
5. Responses to a significant loss (bereavement, financial ruin, losses from a natural disaster, a serious medical illness, or a disability) may include depressive symptoms and require nursing interventions, but such responses do not always lead to major depressive disorder.
6. Need to rule out effects of a substance or another medical condition, especially hypothyroidism
7. Treatment includes counseling, antidepressant medication, and electroconvulsive therapy (ECT).
8. See Box 66.5 for general assessment findings.

B. Major depressive disorder
1. Symptoms
a. Persistent depressed mood nearly every day
b. Diminished interest or pleasure in almost all activities
c. Significant weight change or change in appetite
d. Insomnia or hypersomnia
e. Change in activity loss
f. Fatigue or loss of energy
g. Feelings of worthlessness or excessive guilt
h. Diminished ability to think or concentrate, or indecisiveness
i. Recurrent thoughts of death or suicide
2. The symptoms cause significant impairment in important areas of functioning (family, social interactions, job).

C. Interventions (Box 66.7)

⚠ For a client at risk for self-harm, ask the client directly, "Have you thought of hurting yourself?"

XI. Electroconvulsive Therapy (ECT)

A. Description
1. Although done rarely given newer treatment options available, ECT is a treatment for depression (not a cure). A small amount of an electrical current is delivered through electrodes attached to the temples that cause a brief seizure within the brain; outward movement is usually a slight movement of the hands, feet, or a toe, because premedication is given to relax the muscles. In addition, a short-acting anesthetic is given.
2. The usual course is 6 to 12 treatments given every 2 to 5 days; maintenance ECT once a month may help decrease the relapse rate for a client with recurrent depression.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.7 Interventions for Depressed Clients

Risk for Harm
- Assess for homicidal and suicidal ideation.
- Provide safety from suicidal actions (be certain that there are no harmful objects in the environment).
- Do not leave the client alone for extended periods.
- If the client has a suicidal plan, place on one-to-one supervision.

Activities
- Use gentle encouragement to participate in activities of daily living and unit therapies.
- Do not push decision-making or the making of complex choices or decisions that the client is not ready for.
- Provide achievable activities in which the client can achieve success (focus on strengths).
- Begin with one-to-one activities with the client.
- Provide activities for easy mastery to increase self-esteem and help in alleviating guilt feelings and activities that do not require a great deal of concentration (simple card games, drawing).
- Engage the client in gross motor activities (walking).
- Eventually bring the client into small group activities and then into large groups.

Nutrition
- Monitor nutritional intake and weight, and provide nutritional support.
- Stay with the client during meals to accurately assess intake and to assist in ensuring adequate nutritional intake.

Hygiene Care
- Monitor for general hygiene and self-care deficits; deficits may indicate worsening depression.
- Provide prompts to encourage activities of daily living.

Sleep Patterns
- Monitor sleep patterns.
- Decrease environmental stimuli at bedtime.
- Encourage relaxation techniques.
- Spend time with the client before bedtime to increase comfort and minimize feelings of loneliness and isolation.

Altered Thought Processes
- Remind the client of times when they felt better and were successful.
- Spend time with the client to convey the client's worth and value.
- Encourage the client to discuss losses or changes in the life situation.
- Encourage the client to express sadness or anger, and allow adequate time for verbal responses.
- Respond to anger therapeutically.

3. ECT is not always effective in clients with dysthymic depression, depression and personality disorders, drug dependence, or depression secondary to situational or social difficulties.
4. At-risk clients include clients with recent myocardial infarction, stroke (brain attack), or intracranial mass lesions.

BOX 66.8 Electroconvulsive Therapy (ECT): Indications for Use

- When antidepressant medications have no effect
- When there is a need for a rapid definitive response, such as when a client is suicidal or homicidal
- When the client is in extreme agitation or stupor
- When the risks of other treatments outweigh the risk of ECT
- When the client has a history of poor medication response, a history of good ECT response, or both
- When the client prefers ECT as a treatment

Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 242.

B. Uses (Box 66.8)
1. Clients with severe depressive and bipolar depressive disorders, especially when psychotic symptoms are present, such as delusions of guilt, somatic delusions, and delusions of infidelity
2. Clients who have depression with marked psychomotor retardation and stupor
3. Manic clients whose conditions are resistant to lithium and antipsychotic medications and clients who are rapid cyclers (a client with a bipolar disorder who has many episodes of mood swings close together)
4. Clients with schizophrenia (especially catatonia), clients with schizoaffective syndromes, and psychotic clients

C. Preprocedure
1. Teach the client and family about the procedure.
2. **Informed consent** must be obtained.
3. Maintain NPO (nothing by mouth) status after midnight or at least 4 hours before treatment as prescribed.
4. Baseline vital signs are taken.
5. The client is requested to void.
6. Hairpins, contact lenses, and dentures are removed.
7. Administer preprocedure medication as prescribed.

D. During the procedure
1. As the intravenous line is inserted, electroencephalographic and electrocardiographic electrodes are attached.
2. The blood pressure, pulse, and oxygen saturation are monitored throughout the treatment.
3. A blood pressure cuff is placed around one ankle and inflated to block the medication from entering the foot. When the procedure begins, seizure activity can be monitored by watching for movement in that foot.
4. Medications administered may include a short-acting anesthetic and a muscle relaxant.
5. Oxygen is administered by nasal canula or face mask.

Telegram & Insta: NCLEX_RN_Edu

6. An airway or mouth guard is placed to prevent the client from biting the tongue.
7. An electrical stimulus is administered; a brief seizure occurs (15–70 seconds).

E. Postprocedure

1. The client is transported to a recovery area with the blood pressure cuff and oximeter in place, where oxygen, suction, and other forms of emergency equipment are available.
2. Client wakes about 15 minutes after procedure.
3. When the client is awake, talk to the client and take vital signs.
4. The client may be confused and disoriented for several hours; provide frequent orientation (brief, distinct, and simple) and reassurance.
5. The client returns to the nursing unit when at least an acceptable oxygen saturation level is maintained, vital signs are stable, and mental status is satisfactory.

F. Potential side effects

1. Confusion, disorientation, and short-term memory loss
2. The client may be confused and disoriented on awakening.
3. Other side effects include headache, hypotension, muscle soreness, nausea, and tachycardia.
4. Memory deficits may occur, but memory usually recovers completely, although some clients have memory loss lasting 6 months.

⚠ Monitor both a depressed client and a client who has recently been prescribed an antidepressant medication closely for signs of suicidal ideation. If the client presents with increased energy, monitor closely, because it could mean that the client now has the energy to perform the suicide act.

XII. Schizophrenia

A. Description

1. Schizophrenia is a group of mental health problems characterized by psychotic features (hallucinations and delusions), disordered thought processes, and disrupted interpersonal relationships.
2. Disturbances in affect, mood, behavior, and thought processes occur.
3. Treatment with medication controls symptoms associated with the mental health problem.

B. Assessment (Fig. 66.1)

1. Physical characteristics
   a. Unkempt appearance; may **neglect** hygiene, eating, sleeping, and elimination
   b. Body image distortions
   c. May be preoccupied with somatic complaints
2. Motor activity (Box 66.9)
   a. Catatonic posturing: Holding bizarre postures for long periods

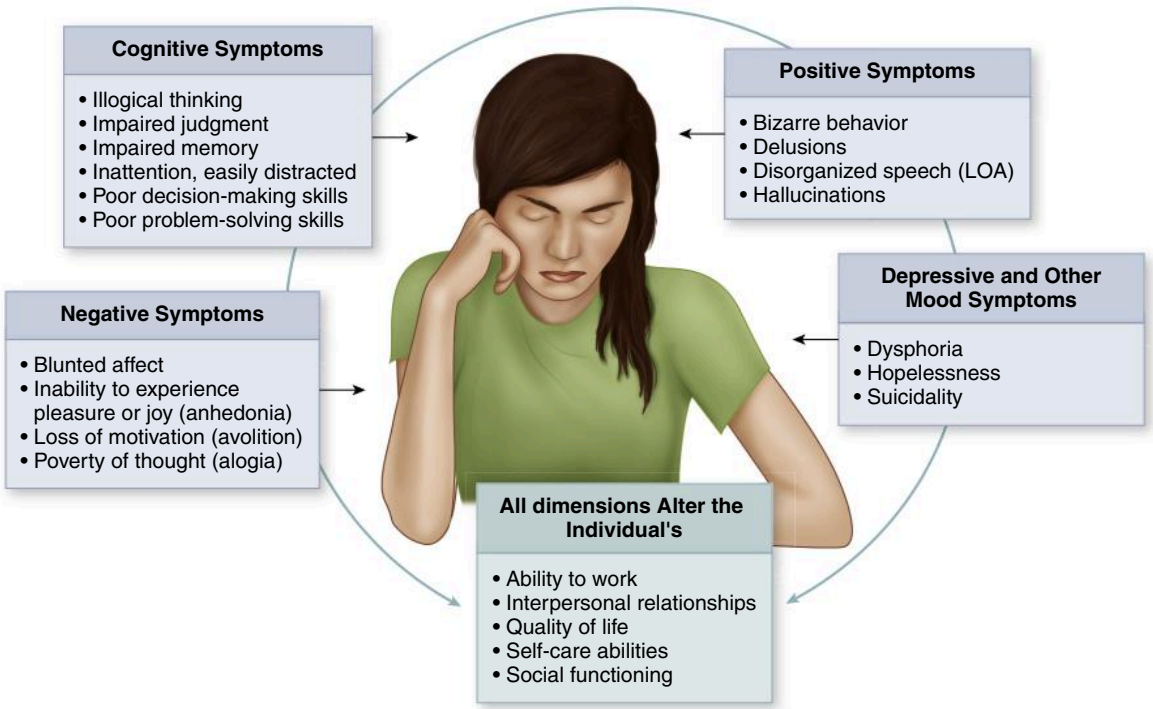

FIG. 66.1 Treatment-relevant dimensions of schizophrenia. *LOA*, Looseness of association. Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 250, 255.

BOX 66.9 Abnormal Motor Behaviors

Description

Abnormal motor behavior or activity displayed by a client with a mental health problem that occurs as a result of a mental health disorder

Types

Echolalia: Repeating the speech of another person
Echopraxia: Repeating the movements of another person
Waxy Flexibility: Having one's arms or legs placed in a certain position and holding that same position for hours

BOX 66.10 Abnormal Thought Processes

Description

Abnormal thought processes displayed by a client with a mental health problem that occur as a result of a mental health disorder

Types

Circumstantiality: Before getting to the point or answering a question, the client gets caught up in countless details and explanations.
Confabulation: Filling a memory gap with detailed fantasy believed by the teller; the purpose of confabulation is to maintain self-esteem; seen in organic conditions such as Korsakoff's psychosis
Flight of Ideas: Constant flow of speech in which the client jumps from one topic to another in rapid succession; a connection between topics exists, although it is sometimes difficult to identify; seen in manic states
Looseness of Association: Haphazard, illogical, and confused thinking and interrupted connections in thought; seen mostly in schizophrenic disorders
Neologisms: Client makes up words that have meaning only to the individual; often part of a delusional system
Thought Blocking: Sudden cessation of a thought in the middle of a sentence; client is unable to continue the train of thought; often, sudden new thoughts unrelated to the topic come up
Word Salad: A mixture of words and phrases that has no meaning

   b. Catatonic excitement: Moving excitedly, with no environmental stimuli present
   c. Possible total immobilization
   d. Inability to respond to commands or responding only to commands
   e. Waxy flexibility
   f. Repetitive or stereotyped movements
   g. Motor activity that may be increased, as evidenced by agitation, pacing, inability to sleep, loss of appetite and weight, and impulsiveness
   h. Possible inability to initiate activity (anergia)
3. Emotional characteristics
   a. Mistrust
   b. View of the world as threatening and unsafe
   c. Affect blunted, flat, or inappropriate
   d. May display feelings of ambivalence, helplessness, anxiety, anger, guilt, or depression in response to hallucinations or delusions or as a result of grief related to losses imposed by the illness
4. Compulsive rituals: Constant repetitive activity performed as an attempt to solve conflicting feelings
5. Overcompliance: Attempt to deny responsibility for any action by doing only what another person instructs exactly
6. Affective disturbances
   a. Flat or incongruent affect or inappropriate affect
   b. Altered thought processes
7. Abnormal thought processes (Box 66.10)
   a. Impaired reality testing
   b. Fragmentation of thoughts
   c. Thought blocking
   d. Loose associations
   e. Echolalia: Pathological repeating of another's words
   f. Distorted perception of the environment
   g. Neologisms: Made-up words that have meaning only to the client
   h. Magical thinking
   i. Inability to conceptualize meaning in words or thoughts
   j. Inability to organize facts logically
   k. Delusions associated with thought processes or content
8. Types of delusions (Box 66.11)
   a. Loss of reference, in which the client believes that certain events, situations, or interactions are related directly to self
   b. Delusions of persecution, in which the client believes that they are being harassed, threatened, or persecuted by some powerful force
   c. Delusions of grandeur, in which the client attaches special significance to self in relation to others or the universe and has an exaggerated sense of self that has no basis in reality
   d. Somatic delusions, in which the client believes that their body is changing or responding in an unusual way; somatic delusions have no basis in reality
9. Perceptual distortions
   a. Illusions, which may be brief experiences with a misinterpretation or misperception of reality
   b. Hallucinations (five senses) with no basis in reality (Box 66.12), such as perceiving objects, sensations, or images

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.11 Delusions

Description

A false belief held to be true, even when there is evidence to the contrary

Types

Grandeur: False belief that one is a powerful and important person

Jealousy: False belief that one's partner or mate is going out with other persons

Persecution: Thought that one is being singled out for harm by others

Interventions

- Ask the client to describe the delusion.
- Be open and honest in interactions to reduce suspiciousness.
- Focus conversation on reality-based topics, rather than on the delusion.
- Encourage the client to express feelings and to focus on feelings that the delusions generate.
- If the client obsesses on the delusion, set firm limits on the amount of time spent talking about the delusion.
- Do not argue with the client or try to convince the client that the delusions are false.
- Validate if part of the delusion is real.

BOX 66.12 Hallucinations

Description

Sense perception (occurs with one of the five senses) for which no external stimuli exist; can have an organic or functional cause

Types

Auditory: Hearing voices when none are present

Gustatory: Experiencing taste in the absence of stimuli

Olfactory: Smelling smells that do not exist

Tactile: Feeling touch sensations in the absence of stimuli

Visual: Seeing things that are not there

Interventions

- Ask the client directly about the hallucination.
- Avoid reacting to the hallucination as if it were real.
- Decrease stimuli or move the client to another area.
- Do not negate the client's experience.
- Focus on reality-based topics.
- Attempt to engage the client's attention through a concrete activity.
- Respond verbally to anything real that the client talks about.
- Avoid touching the client.
- Monitor for signs of increasing anxiety or agitation, which may indicate that hallucinations are increasing.

10. Language and communication disturbances (Box 66.13)
    - **a.** Related to disorders in thought process
    - **b.** Inability to organize language
    - **c.** Difficulty communicating clearly
    - **d.** Inappropriate responses to a situation
    - **e.** A single word or phrase may represent the whole meaning of the conversation such that the client may feel that they have communicated adequately.
    - **f.** Development of a private language
C. Interventions: Schizophrenia (Box 66.14)
D. Interventions: Active hallucinations (see Clinical Judgment: Take Action box)

BOX 66.13 Language and Communication Disturbances

Alogia (poverty of speech): Reduced volume or lack of spontaneous comments and overly brief responses

Associative Looseness: Disjointed mental threads that tie thoughts logically together

Clang Association: Repetition of words or phrases that are similar in sound but in no other way

Echolalia: Repetition of words or phrases heard from another person

Mutism: Absence of verbal speech

Neologism: A newly devised word that has special meaning only to the client

Pressured Speech: Speaking as if the words are being forced out quickly

Religiosity: Excessive preoccupation with religious ideas

Tangentiality: Digression from one topic to another without ever completing the thought or reaching a conclusion

Verbigeration: Purposeless repetition of words or phrases

Word Salad (Schizophasia): Form of speech in which words or phrases are connected meaninglessly

CLINICAL JUDGMENT: TAKE ACTION

A client with schizophrenia is experiencing visual hallucinations. The nurse takes the following actions:

- Monitors for hallucination cues and assesses content of hallucinations
- Intervenes with one-on-one contact
- Decreases stimuli or moves the client to another area
- Avoids conveying to the client that others also are experiencing the hallucination
- Responds verbally to anything real that the client talks about
- Avoids touching the client
- Encourages the client to express feelings
- During a hallucination, attempts to engage the client's attention through a concrete activity
- Accepts and does not joke about or judge the client's behavior
- Provides easy activities and a structured environment with routine activities of daily living
- Monitors for signs of increasing fear, anxiety, or agitation
- Decreases stimuli as needed
- Administers medications as prescribed

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.14 Interventions for Schizophrenia

- Maintain a safe environment.
- Set limits on the client's behavior if the client is unable to do so, especially when it interferes with others and becomes disruptive.
- Assess the client's physical needs.
- Initiate one-on-one interaction and progress to small groups as tolerated.
- Monitor for altered thought processes.
- Maintain ego boundaries and avoid touching the client.
- Avoid an overly warm approach; a neutral approach is less threatening.
- Do not make promises to the client that cannot be kept.
- Establish daily routines.
- Assist the client to improve grooming and accept responsibility for personal care.
- Provide brief, frequent contact with the client; limit time of interaction with the client.
- Tell the client when you are leaving.
- Tell the client when you do not understand what the client is saying.
- Do not "go along" with the client's delusions or hallucinations.
- Provide simple, concrete activities, such as puzzles or word games.
- Reorient the client as necessary.
- Help the client establish what is real and unreal.
- Stay with the client if the client is frightened.
- Speak to the client in a simple, direct, and concise manner.
- Reassure the client that the environment is safe.
- Remove the client from group situations if the client's behavior is too bizarre, disturbing, or dangerous to others.
- Set realistic goals.
- Initially, do not offer choices to the client; then gradually assist the client in making personal decisions.
- Decrease excessive stimuli in the environment.
- Monitor for suicide risk.
- Assist the client to use alternative means to express feelings, such as through music, art therapy, or writing.

For a client with hallucinations, safety is the first priority; ensure that the client does not have an auditory command telling the client to harm self or others.

E. Interventions: Delusions

1. Interact based on reality.
2. Encourage the client to express feelings.
3. Do not dispute the client or try to convince the client that delusions are false.
4. Initiate activities on a one-on-one basis.
5. Alter hospital routines as necessary, such as by using canned or packaged food or food from home.
6. Recognize accomplishments and provide positive feedback for successes.

XIII. Personality Disorders

A. Description

1. Personality disorders involve the consistent expression of various inflexible maladaptive behavioral patterns or traits that may impair functioning and relationships.
2. The client usually remains in touch with reality and typically has a significant lack of insight in self-identity and interpersonal behavior (empathy or intimacy).
3. Stress exacerbates manifestations of the personality disorder.
4. Not directly associated with the effects of substance misuse or a general medical condition, such as severe head injury.

B. Characteristics

1. Poor impulse control
   - **a.** Acting out to manage internal pain
   - **b.** Forms of acting out include physical and verbal attacks, such as yelling and swearing, and self-injurious behaviors, such as cutting own skin, banging the head, punching self, manipulation, substance abuse, promiscuous sexual behaviors, and **suicide attempts**.
   - **c.** The client may be preoccupied with such things as self, religion, or sex.
2. Mood characteristics
   - **a.** May experience abandonment and depression
   - **b.** Moods may include rage, guilt, fear, and emptiness.
3. Impaired judgment
   - **a.** Difficulty with problem-solving
   - **b.** Inability to perceive the consequences of behavior
4. Impaired reality testing: Distortion of reality and often projection of own feelings onto others
5. Impaired object relations: Rigid and inflexible, with difficulty in intimate relationships
6. Impaired self-perception: Distorted self-perception and experience of self-hate or self-idealization
7. Impaired thought processes
   - **a.** Concrete or diffuse thinking
   - **b.** Difficulty concentrating
   - **c.** Impaired memory
8. Impaired stimulus barrier
   - **a.** Inability to regulate incoming sensory stimuli
   - **b.** Increased excitability
   - **c.** Excessive response to noise and light
   - **d.** Poor attention span
   - **e.** Agitation
   - **f.** Insomnia

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

C. Cluster A personality disorder types include the odd disorders—schizoid, schizotypal, and paranoid.

1. Schizoid personality disorder is characterized by an inability to form warm, close social relationships.
- **a.** Social detachment and lack of close relationships
- **b.** Interest in solitary activities
- **c.** Aloofness and indifference
- **d.** Restricted expression of emotions
- **e.** Lack of interest in others

2. Schizotypal personality disorder is characterized by the display of abnormal or highly unusual thoughts, perceptions, speech, and behavioral patterns.
- **a.** Suspiciousness and paranoia
- **b.** Unable to understand how behaviors impact others
- **c.** Eccentricity
- **d.** Magical thinking
- **e.** Odd thinking and speech
- **f.** Relationship deficits
- **g.** Blunted affect
- **h.** Reclusiveness

3. Paranoid personality disorder is characterized by suspiciousness and mistrust of others (paranoia) (Box 66.15).
- **a.** May be suspicious and distrusting
- **b.** May be argumentative
- **c.** May be hostile or aloof
- **d.** May be rigid, critical, and controlling of others
- **e.** May have thoughts of grandiosity

⚠ Do not whisper or laugh in front of a client with a paranoid personality disorder, because the client will think that you are talking about or laughing at them; this increases the paranoia.

BOX 66.15 Interventions for Paranoia

- Provide a safe environment.
- Assure the client that they will be safe.
- Assess for suicide risk.
- Diminish suspicious behavior, such as whispering.
- Remain calm, nonthreatening, and nonjudgmental.
- Engage the client during brief but frequent interactions.
- Establish a trusting relationship.
- Maintain physical boundaries and avoid crowding the client.
- Promote increased self-esteem.
- Respond honestly to the client.
- Follow through on commitments made to the client.
- Acknowledge the client's feelings, but tell the client that you do not share their interpretation of an event.
- Provide a daily schedule of activities.
- Assist the client to identify diversionary activities.
- Gradually introduce the client to groups.
- Refocus conversation to reality-based topics.
- Use role playing to help the client identify thoughts and feelings.
- Provide positive reinforcement for successes.
- Do not argue with delusions.
- Do not whisper in the client's presence.
- Provide the client with the opportunity to complete small tasks.
- Monitor eating, drinking, sleeping, and elimination patterns.
- Monitor for agitation, and decrease stimuli as needed.

D. Cluster B personality disorders include the dramatic, emotional, erratic types—histrionic, narcissistic, antisocial, and borderline.

1. Histrionic personality disorder is characterized by overly dramatic and intensely expressive behavior.
- **a.** Lively and dramatic and enjoys being the center of attention
- **b.** Has poor and shallow interpersonal relationships
- **c.** May be sexually seductive or provocative
- **d.** Dramatizes personal life and may appear theatrical
- **e.** Overly concerned with appearance
- **f.** Easily bored

2. Narcissistic personality disorder is characterized by an increased sense of self-importance and a preoccupation with fantasies and unlimited success.
- **a.** Fragile self-esteem
- **b.** Need for admiration and inflation of accomplishments
- **c.** Overestimation of abilities and underestimation of contributions of others
- **d.** Lack of empathy and sensitivity to needs of others

3. Antisocial personality disorder comprises a pattern of irresponsible and antisocial behavior, selfishness, an inability to maintain lasting relationships, poor sexual adjustment, a failure to accept social norms, and a tendency toward irritability and aggressiveness.
- **a.** Perceives the world as hostile
- **b.** Lack of empathy or feelings of remorse
- **c.** Egocentrism; focused on personal gratification
- **d.** Deceitful and manipulative
- **e.** Irresponsible
- **f.** Impulsive and engages in risk-taking behaviors
- **g.** Persistent or frequent feelings of anger
- **h.** Refusal to conform to social rules and normative behavior

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

4. Borderline personality disorder is characterized by instability in interpersonal relationships, unstable mood and self-image, and impulsive and unpredictable behavior.
   a. Poor self-regard or unstable self-image
   b. Unstable and intense personal relationships
   c. Lack of empathy toward the needs and feelings of others
   d. Extreme shifts in mood
   e. Impulsive
   f. Self-damaging behaviors, such as cutting
   g. Engages in risk-taking behaviors
   h. Argumentative and hostile in response to perceived slights or insults
   i. Manipulation
   j. Intense feeling of anxiety in response to stress
   k. Chronic feelings of emptiness and intense fear of being rejected
   l. Splitting—sees others as all good or all bad; creates conflict between individuals by playing one person against another

E. Cluster C personality disorders include the anxious, fearful types of personality disorders—obsessive-compulsive personality, avoidant, and dependent.
   1. Obsessive-compulsive personality disorder is characterized by difficulty in expressing warm and tender emotions, perfectionism, stubbornness, the need to control others, and a devotion to work.
      a. Perfectionist with unreasonably high expectations of self
      b. Inflexible and preoccupied with details and rules
      c. Sense of self derived primarily from work
      d. Social and personal relationship viewed as secondary to work and productivity
      e. Difficulty with understanding the ideas, feelings, and behaviors of others
      f. Engages in rituals
   2. Avoidant personality disorder is characterized by social withdrawal and extreme sensitivity to potential rejection.
      a. Feelings of inadequacy
      b. Hypersensitive to reactions of others and poor reaction to criticism
      c. Social isolation
      d. Lack of support system
   3. Dependent personality disorder is characterized by an intense lack of self-confidence, low self-esteem, and inability to function independently, such that the individual passively allows others to make decisions and assume responsibility for major areas in the person's life; the dependent client has great difficulty in making decisions.

F. General interventions for a client with a personality disorder
   1. Maintain safety against self-destructive behaviors.
   2. Ensure that the health care team is consistent with information and response to the client's acting-out behaviors.
   3. Allow the client to make choices and be as independent as possible.
   4. Encourage the client to discuss feelings rather than act them out.
   5. Encourage the client to keep a journal to record daily feelings.
   6. Discuss expectations and responsibilities with the client.
   7. Discuss the consequences that will follow certain behaviors.
   8. Inform the client that harm to self, others, and property is unacceptable.
   9. Develop a written safety or behavioral contract with the client.
   10. Identify splitting behavior.
   11. Assist the client to deal directly with anger.
   12. Encourage the client to participate in group activities, and praise nonmanipulative behavior.
   13. Set and maintain limits to decrease manipulative behavior.
   14. Remove the client from group situations in which attention-seeking behaviors occur.
   15. Provide realistic praise for positive behaviors in social situations.

XIV. Neurodevelopmental Disorders

A. Autism spectrum disorder: See Chapter 39.
B. Attention-deficit/hyperactivity disorder: See Chapter 39.

XV. Neurocognitive Disorders

A. Dementia and Alzheimer's disease
   1. Dementia
      a. Dementia is a syndrome with progressive deterioration in intellectual functioning secondary to structural or functional changes.
      b. Long-term and short-term memory loss occurs, with impairment in judgment, abstract thinking, problem-solving ability, and behavior.
      c. Dementia results in a self-care deficit.
      d. Dementia-like symptoms can be a result of physiological conditions, and such conditions must be ruled out initially.
      e. The most common type of dementia is Alzheimer's disease.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 66.16 Alzheimer's Disease

Agnosia: Failure to recognize or identify familiar objects despite intact sensory function
Amnesia: Loss of memory caused by brain degeneration
Aphasia: Language disturbance in understanding and expressing spoken words
Apraxia: Inability to perform motor activities, despite intact motor function

2. Alzheimer's disease (Box 66.16)
   - **a.** Alzheimer's disease is an irreversible form of senile dementia caused by nerve cell deterioration.
   - **b.** Individuals with Alzheimer's disease experience cognitive deterioration and progressive loss of ability to carry out activities of daily living.
   - **c.** The client experiences a steady decline in physical and mental functioning and usually requires long-term care in a specialized facility in the final stages of the illness.
   - **d.** Stages and major characteristics of Alzheimer's disease: Stage 1 (mild): forgetfulness; stage 2 (moderate): confusion; stage 3 (moderate to severe): ambulatory dementia; and stage 4 (late): end stage.
3. Interventions
   - **a.** Identify and reinforce retained skills.
   - **b.** Provide continuity of care.
   - **c.** Orient the client to the environment.
   - **d.** Furnish the environment with familiar possessions.
   - **e.** Acknowledge the client's feelings.
   - **f.** Assist the client and family members to manage memory deficits and behavioral changes.
   - **g.** Encourage family members to express feelings about caregiving.
   - **h.** Provide the caregiver with support, and identify the resources and support groups available.
   - **i.** Monitor the client's activities of daily living.
   - **j.** Remind the client how to perform self-care activities.
   - **k.** Help the client maintain independence.
   - **l.** Provide the client with consistent routines.
   - **m.** Provide the client with exercise, such as walking with an escort.
   - **n.** Avoid activities that tax the memory.
   - **o.** Allow the client plenty of time to complete a task.
   - **p.** Use constant encouragement with the client with a simple step-by-step approach.
   - **q.** Provide the client with activities that distract and occupy time, such as listening to music, coloring, and watching television.
   - **r.** Provide the client with mental stimulation with simple games or activities.
4. Wandering
   - **a.** Provide the client with a safe environment free of clutter and hazardous items.
   - **b.** Provide safe ambulation, including mobility aids and comfortable and well-fitting shoes.
   - **c.** Provide close and frequent supervision.
   - **d.** Close and secure doors.
   - **e.** Use identification bracelets and electronic surveillance.
   - **f.** Encourage rest periods in the afternoon, because wandering worsens at night.
   - **g.** Provide regular supervised exercise or walking programs.
   - **h.** Sundown syndrome (sundowning) is characterized by a pronounced increase in symptoms and problem behaviors in the evening.

! Providing a safe environment is a priority in the care of a client with Alzheimer's disease.

5. Communication disorders
   - **a.** Disorders include language disorder (expressive–receptive disorder), speech sound disorder (phonological disorder), childhood-onset fluency disorder (stuttering disorder), and social communication disorder (impaired social communication).
   - **b.** Adapt to the communication level of the client.
   - **c.** Pay attention to nonverbal cues.
   - **d.** Use a firm volume and a low-pitched voice to communicate.
   - **e.** Stand directly in front of the client and maintain eye contact.
   - **f.** Give ample time for the client to respond.
   - **g.** Use a calm and reassuring voice. Do not speak loudly unless the client is hearing-impaired.
   - **h.** Use pantomime gestures if the client is unable to understand spoken words.
   - **i.** Speak slowly and clearly, using short words and simple sentences.
   - **j.** Ask only one question at a time and give one direction at a time.
   - **k.** Repeat questions if necessary, but do not rephrase.
   - **l.** Provide alternative means of communication.
   - **m.** Minimize external noise or distractions when communicating.
6. Impaired judgment
   - **a.** Remove throw rugs, toxic substances, and dangerous electrical appliances from the environment.
   - **b.** Reduce hot water heater temperature.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. Altered thought processes
   - **a.** Call the client by name.
   - **b.** Orient the client frequently.
   - **c.** Use familiar objects in the room.
   - **d.** Place a calendar and clock in a visible place.
   - **e.** Maintain familiar routines.
   - **f.** Allow the client to reminisce.
   - **g.** Make tasks simple.
   - **h.** Allow time for the client to complete a task.
   - **i.** Provide positive reinforcement for positive behaviors.
8. Altered sleep patterns
   - **a.** Allow the client to wander in a safe place until the client becomes tired.
   - **b.** Prevent shadows in the room by using indirect light.
   - **c.** Avoid the use of hypnotics because they cause confusion and aggravate the sundown effect.
9. Agitation
   - **a.** Assess the precipitant of the agitation.
   - **b.** Reassure the client.
   - **c.** Remove items that can be hazardous when the client is agitated.
   - **d.** Approach the client slowly and calmly from the front, and speak, gesture, and move slowly.
   - **e.** Remove the client to a less stressful environment; decrease excess stimuli.
   - **f.** Use touch gently.
   - **g.** Do not argue with or force the client to do something.

PRACTICE QUESTIONS

1. A client says to the nurse, "The federal guards were sent to kill me." Which is the **best** response by the nurse to the client's concern?
   1. "I don't believe this is true."
   2. "The guards are not out to kill you."
   3. "Do you feel afraid that people are trying to hurt you?"
   4. "What makes you think the guards were sent to hurt you?"

2. A client diagnosed with delirium becomes disoriented and confused at night. Which intervention would the nurse implement **initially**?
   1. Move the client next to the nurses' station.
   2. Use an indirect light source and turn off the television.
   3. Keep the television and a soft light on during the night.
   4. Play soft music during the night, and maintain a well-lit room.

3. A client is admitted to the mental health unit with a diagnosis of depression. The nurse would develop a plan of care for the client that includes which intervention?
   1. Encouraging quiet reading and writing for the first few days
   2. Identification of physical activities that will provide exercise
   3. No socializing activities until the client asks to participate in milieu
   4. A structured program of activities in which the client can participate

4. When planning the discharge of a client with chronic anxiety, which is the **most appropriate** maintenance goal?
   1. Suppressing feelings of anxiety
   2. Identifying anxiety-producing situations
   3. Continuing contact with a crisis counselor
   4. Eliminating all anxiety from daily situations

5. A client is unwilling to go to church because the ex-spouse goes there and the client feels that the ex-spouse will laugh at the client. Because of this hypersensitivity to a reaction from the spouse, the client remains homebound. The home care nurse develops a plan of care that addresses which personality disorder?
   1. Avoidant
   2. Borderline
   3. Schizotypal
   4. Obsessive-compulsive

6. The nurse is conducting a group therapy session. During the session, a client diagnosed with mania consistently disrupts the group's interactions. Which intervention would the nurse **initially** implement?
   1. Setting limits on the client's behavior
   2. Asking the client to leave the group session
   3. Asking another nurse to escort the client out of the group session
   4. Telling the client that they will not be able to attend any future group sessions

7. A client is admitted to a medical nursing unit with a diagnosis of acute blindness after being involved in a hit-and-run accident. When diagnostic testing cannot identify any organic reason why this client cannot see, a mental health consult is prescribed. The nurse plans care based on which mental health condition?
   1. Psychosis
   2. Repression
   3. Conversion disorder
   4. Dissociative disorder

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

8. A manic client begins to make sexual advances toward visitors in the dayroom. When the nurse firmly states that this is inappropriate and will not be allowed, the client becomes verbally abusive and threatens physical violence to the nurse. Based on the analysis of this situation, which intervention would the nurse implement?
1. Place the client in seclusion for 30 minutes.
2. Tell the client that the behavior is inappropriate.
3. Escort the client to their room, with the assistance of other staff.
4. Tell the client that their telephone privileges are revoked for 24 hours.

9. Which nursing interventions are appropriate for a hospitalized client with mania who is exhibiting manipulative behavior? **Select all that apply.**
- ❑ 1. Communicate expected behaviors to the client.
- ❑ 2. Ensure that the client knows that they are not in charge of the nursing unit.
- ❑ 3. Assist the client in identifying ways of setting limits on personal behaviors.
- ❑ 4. Follow through about the consequences of behavior in a nonpunitive manner.
- ❑ 5. Enforce rules by informing the client that they will not be allowed to attend therapy groups.
- ❑ 6. Have the client state the consequences for behaving in ways that are viewed as unacceptable.

10. The nurse observes that a client is pacing, agitated, and presenting aggressive gestures. The client's speech pattern is rapid, and affect is belligerent. Based on these observations, which is the nurse's **immediate priority** of care?
1. Provide safety for the client and other clients on the unit.
2. Provide the clients on the unit with a sense of comfort and safety.
3. Assist the staff in caring for the client in a controlled environment.
4. Offer the client a less stimulating area in which to calm down and gain control.

11. The nurse is preparing a client with schizophrenia and a history of command hallucinations for discharge by providing instructions on interventions for managing hallucinations and anxiety. Which statement in response to these instructions suggests to the nurse that the client has a **need for additional information**?
1. "My medications will help my anxious feelings."
2. "I'll go to support group and talk about what I am feeling."
3. "When I have command hallucinations, I'll call a friend for help."
4. "I need to get enough sleep and eat well to help prevent feeling anxious."

12. The nurse is caring for a client just admitted to the mental health unit and diagnosed with catatonic stupor. The client is lying on the bed in a fetal position. Which is the **most appropriate** nursing intervention?
1. Ask direct questions to encourage talking.
2. Leave the client alone so as to minimize external stimuli.
3. Sit beside the client in silence with simple open-ended questions.
4. Take the client into the dayroom with other clients to provide stimulation.

13. The nurse is caring for a client diagnosed with paranoid personality disorder who is experiencing disturbed thought processes. In formulating a nursing plan of care, which **best** intervention would the nurse include?
1. Increase socialization of the client with peers.
2. Avoid using a whisper voice in front of the client.
3. Begin to educate the client about social supports in the community.
4. Have the client sign a release of information to appropriate parties for assessment purposes.

14. The nurse is planning activities for a client diagnosed with bipolar disorder with aggressive social behavior. Which activity would be **most appropriate** for this client?
1. Chess
2. Writing
3. Board games
4. Group exercise

Telegram & Insta: NCLEX_RN_Edu

ANSWERS

1. *Answer:* 3

Rationale: It is most therapeutic for the nurse to empathize with the client's experience. The remaining options lack this connection with the client. Disagreeing with delusions may make the client more defensive, and the client may cling to the delusions even more. Encouraging discussion regarding the delusion is inappropriate.

Test-Taking Strategy: Note the **strategic word,** *best.* Use **therapeutic communication techniques.** Eliminate options that show disagreement with the client or encourage any discussion regarding the delusion.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93-95, 265.

2. *Answer:* 2

Rationale: Provision of a consistent daily routine and a low-stimulating environment is important when a client is disoriented. Noise, including radio and television, may add to the confusion and disorientation. Moving the client next to the nurses' station may become necessary but is not the initial action.

Test-Taking Strategy: Note the **strategic word,** *initially.* Eliminate options that are inappropriate or premature actions and may increase stimulation and add to the confusion. This will direct you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 284.

3. *Answer:* 4

Rationale: A client with depression often is withdrawn while experiencing difficulty concentrating, loss of interest or pleasure, low energy, fatigue, and feelings of worthlessness and poor self-esteem. The plan of care needs to provide successful experiences in a stimulating yet structured environment. The remaining options are either too "restrictive" or offer little or no structure and stimulation.

Test-Taking Strategy: Focus on the **subject,** the plan for a client with depression. Recall that a depressed client requires a structured and stimulating program in a safe environment. The correct option is the only one that will provide a safe and effective environment.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 210.

4. *Answer:* 2

Rationale: Recognizing situations that produce anxiety allows the client to prepare to cope with anxiety or avoid a specific stimulus. Counselors will not be available for all anxiety-producing situations, and this option does not encourage the development of internal strengths. Suppressing feelings will not resolve anxiety. Elimination of all anxiety from life is impossible.

Test-Taking Strategy: Focus on the **strategic words,** *most appropriate.* Eliminate any option that contains the **closed-ended word** "all" or suggests that feelings should be suppressed. Note that the correct option is more client-centered and helps prepare the client to deal with anxiety should it occur.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 145-147.

5. *Answer:* 1

Rationale: The avoidant personality disorder is characterized by social withdrawal and extreme sensitivity to potential rejection. The person retreats to social isolation. Borderline personality disorder is characterized by unstable mood and self-image and impulsive and unpredictable behavior. Schizotypal personality disorder is characterized by the display of abnormal thoughts, perceptions, speech, and behaviors. Obsessive-compulsive personality disorder is characterized by perfectionism, the need to control others, and a devotion to work.

Test-Taking Strategy: Focus on the **subject,** a type of personality disorder. Focusing on the words *hypersensitivity to a reaction* will direct you to the correct option.

Reference: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. p. 277.

6. *Answer:* 1

Rationale: Manic clients may be talkative and can dominate group meetings or therapy sessions by their excessive talking. If this occurs, the nurse initially would set limits on the client's behavior. Initially, asking the client to leave the session or asking another person to escort the client out of the session is inappropriate. This may agitate the client and escalate the client's behavior further. Barring the client from group sessions is also an inappropriate action because it violates the client's right to receive treatment and is a threatening action.

Test-Taking Strategy: Note the **strategic word,** *initially.* Eliminate options that are **comparable or alike** and relate to the client leaving the session. Next, eliminate the option that violates the client's right to receive treatment and is a threatening action. Remember that setting firm limits with the client initially is best.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 28-29, 234.

7. *Answer:* 3

Rationale: A conversion disorder is the alteration or loss of a physical function that cannot be explained by any known pathophysiological mechanism. A conversion disorder is thought to be an expression of a psychological need or conflict. In this situation, the client witnessed an accident that was so psychologically painful that the client became blind. Psychosis is a state in which a person's mental capacity to recognize reality, communicate, and relate to others is impaired, interfering with the person's ability to deal with life's demands. Repression is a coping mechanism in which unacceptable feelings are kept out of awareness. A dissociative disorder is a disturbance or alteration in the normally integrative functions of identity, memory, or consciousness.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Test-Taking Strategy: Focus on the **subject,** the cause of acute blindness. The key to the correct option lies in the fact that the client presents no organic reason to account for the blindness—hence, a conversion disorder.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 140.

8. *Answer:* 3
Rationale: The client is at risk for injury to self and others and should be escorted out of the dayroom. Seclusion is premature in this situation. Telling the client that the behavior is inappropriate has already been attempted by the nurse. Denying privileges may increase the agitation that already exists in this client.
Test-Taking Strategy: Eliminate option 2 because this intervention has already been attempted. Next, use **Maslow's Hierarchy of Needs theory** to answer the question. Remember that if a physiological need is not present, focus on safety. Look for the option that promotes safety of the client, other clients, and staff.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 235-236.

9. *Answer*: 1, 3, 4, 6
Rationale: Interventions for dealing with the client exhibiting manipulative behavior include setting clear, consistent, and enforceable limits on manipulative behaviors; being clear with the client regarding the consequences of exceeding the limits set; following through with the consequences in a nonpunitive manner; and assisting the client in identifying a means of setting limits on personal behaviors. Ensuring that the client knows that they are not in charge of the nursing unit is inappropriate; power struggles need to be avoided. Enforcing rules by informing the client that they will not be allowed to attend therapy groups is a violation of a client's rights.
Test-Taking Strategy: Focus on the **subject,** manipulative behavior. Recalling clients' rights and that power struggles need to be avoided will assist in selecting the correct interventions.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 234, 237.

10. *Answer:* 1
Rationale: Safety of the client and other clients is the immediate priority. The correct option is the only one that addresses the safety needs of the client as well as those of the other clients.
Test-Taking Strategy: Note the **strategic words,** *immediate priority*, and use **Maslow's Hierarchy of Needs theory** to prioritize. Note the words *agitated, aggressive,* and *belligerent.* Safety is the priority focus if a physiological need does not exist. Also, the correct option is the **umbrella option** and addresses the safety of all.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 382-383.

11. *Answer:* 3
Rationale: The risk for impulsive and aggressive behavior may increase if a client is receiving command hallucinations to harm self or others. If the client is experiencing a hallucination, the nurse or health care counselor, not a friend, would be contacted to discuss whether the client has intentions for self-harm or to hurt others. Talking about auditory hallucinations can interfere with subvocal muscular activity associated with a hallucination. The client statements in the remaining options will aid in wellness but are not specific interventions for hallucinations, if they occur.
Test-Taking Strategy: Note the **strategic words,** *need for additional information*. These words indicate a **negative event query** and the need to select the incorrect client statement as the answer. Focus on the **subject,** managing hallucinations and anxiety. Option 3 includes the incorrect statement of calling a friend for help instead of a nurse or health care counselor. Therefore, option 3 is the correct answer to this question. The remaining options are interventions that a client can carry out to aid wellness.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 255.

12. *Answer:* 3
Rationale: Clients who are withdrawn may be immobile and mute and may require consistent, repeated approaches. Communication with withdrawn clients requires much patience from the nurse. Interventions include the establishment of interpersonal contact. The nurse facilitates communication with the client by sitting in silence, asking simple open-ended questions rather than direct questions, and pausing to provide opportunities for the client to respond. Although overstimulation is not appropriate, there is no therapeutic value in ignoring the client. The client's safety is not the responsibility of other clients.
Test-Taking Strategy: Note the **strategic words,** *most appropriate.* Eliminate options either that are nontherapeutic or could result in overstimulation. Also eliminate options that are not examples of therapeutic communication. The correct option provides for client supervision and communication as appropriate.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 257.

13. *Answer:* 2
Rationale: Disturbed thought process related to paranoid personality disorder is the client's problem, and the plan of care must address this problem. The client is distrustful and suspicious of others. The members of the health care team need to establish a rapport and trust with the client. Laughing or whispering in front of the client would be counterproductive. The remaining options ask the client to trust on a multitude of levels. These options are actions that are too intrusive for a client with this disorder.
Test-Taking Strategy: Focus on the **subject,** interventions for paranoid personality disorder, and note the **strategic word,** *best*. Note that the client has paranoia; thinking about its definition will direct you to the correct option.

14. *Answer:* 2

Rationale: Solitary activities that require a short attention span with mild physical exertion are the most appropriate activities for a client who is exhibiting aggressive behavior. Writing (journaling), walks with staff, and finger painting are activities that minimize stimuli and provide a constructive release for tension. The remaining options have a competitive element to them or are group activities and need to be avoided because they can stimulate aggression and increase psychomotor activity.

Test-Taking Strategy: Note the **strategic words,** *most appropriate.* Eliminate options that include activities that the client cannot do alone and are competitive in nature. The correct option identifies a solitary activity.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 236.

CHAPTER 67

Addictions

Contributor: Michael Johnson, PhD, RN, PMH-BC, CNE

PRIORITY CONCEPTS **Addiction; Coping**

I. Eating Disorders

A. Description: Eating disorders are characterized by unsure self-identification and grossly disturbed eating habits (Fig. 67.1).

B. Compulsive overeating

1. Compulsive overeating is binge-like overeating without purging.
2. Food consumption is out of the individual's control and occurs in a stereotyped fashion.
3. Repulsed by eating; that is, the eating relieves tension but does not produce pleasure.
4. Aware that eating patterns are abnormal and feels depressed after eating
5. Eats secretly during a binge and consumes high-calorie and easily digestible food
6. Repeatedly tries to diet, but without success
7. Feels helpless and hopeless about weight
8. Responds to feelings of guilt, anger, depression, boredom, loneliness, inadequacy, or ambivalence by eating.

C. Anorexia nervosa

1. Description
   - **a.** Onset often is associated with a stressful life event.
   - **b.** Intensely fears obesity
   - **c.** Body image is distorted, and a disturbed self-concept is common.
   - **d.** Preoccupied with foods that prevent weight gain and has a phobia against foods that produce weight gain
   - **e.** The eating disorder can be life-threatening.
   - **f.** Death can occur from starvation, suicide, cardiomyopathies, or electrolyte imbalances.
2. Assessment
   - **a.** Appetite loss and refusal to eat
   - **b.** Appetite denial
   - **c.** Feelings of lack of control
   - **d.** Compulsive exercising
   - **e.** Overachiever and perfectionist
   - **f.** Physical alterations: Many occur and can include decreased temperature, pulse, and blood pressure; weight loss; gastrointestinal disturbances such as constipation; teeth and gum deterioration; esophageal varices from induced vomiting; electrolyte imbalances; dry, scaly skin; presence of lanugo on extremities; sleep disturbances; hormone deficiencies; amenorrhea for at least three consecutive menstrual periods; cyanosis and numbness of extremities; and bone degeneration.

D. Bulimia nervosa

1. Description
   - **a.** Indulges in eating binges followed by purging behaviors
   - **b.** Repeated episodes of excessive and uncontrollable consumption of large amounts of food (binges) followed by inappropriate compensatory actions such as self-induced vomiting, misuse of cathartics (e.g., laxatives), diuretics, and/or self-starvation
   - **c.** Most clients remain within a normal weight range but think that their lives are dominated by the eating-related conflict.
2. Assessment
   - **a.** Preoccupied with body shape and weight
   - **b.** Preoccupation with thoughts of food
   - **c.** Extreme fear of gaining weight
   - **d.** Consumption of high-calorie food in secret; guilt about secretive eating
   - **e.** Binge-purge syndrome
   - **f.** Attempts to lose weight through diets, vomiting, enemas, cathartics, and amphetamines or diuretics
   - **g.** Has a need to control, yet experiences feelings of powerlessness or loss of control
   - **h.** Low self-esteem

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

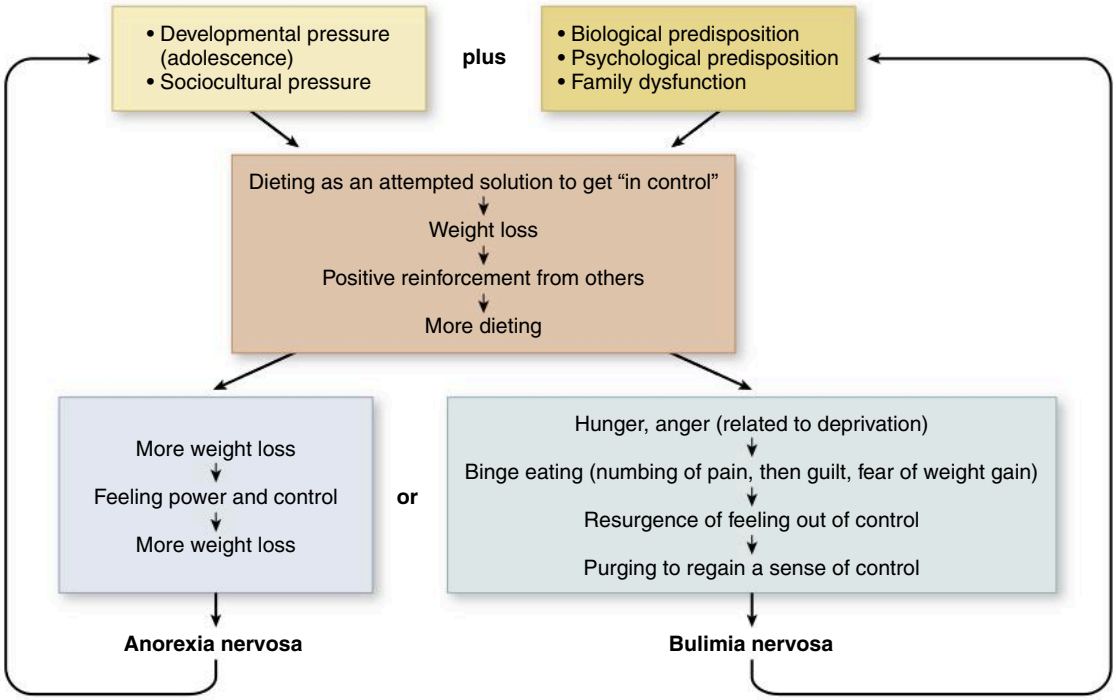

FIG. 67.1 Cycle of eating disorders.

i. Poor interpersonal relationships
j. Decreased interest, or absence of interest, in sex
k. Mood swings
l. Electrolyte imbalances
m. Physical alterations: Similar to those that occur with anorexia nervosa

E. Interventions: Clients with an eating disorder
1. Establish a one-to-one therapeutic relationship with the client; the nurse needs to establish trust and recognize any client reluctance to establish a relationship.
2. Establish a plan concerning the nutritional plan for the day.
3. Assist to identify precipitants to the eating disorder.
4. Encourage the client to express feelings about the eating behavior and how the client feels about their body.
5. Be accepting and nonjudgmental.
6. Work on exploring self-concept and establishing identity.
7. Implement behavior modification techniques.
8. Individual, group, and family therapy
9. If in a health care facility, supervise during mealtimes and for a specified period after meals, and monitor intake and output; set a time limit for each meal, and provide a pleasant, relaxed environment for eating.
10. Monitor for signs of physical complications related to the eating disorder.
11. When a client's weight is below 75% of ideal body weight, provide immediate medical stabilization as an inpatient.
12. Weigh daily at the same time, using the same scale, after the client voids (weighing each day may decrease anxiety in some clients); when weighing the client, ensure that the client is wearing the same clothing as when the previous weight was taken.
13. Monitor and restore fluid and electrolyte balance.
14. Monitor elimination patterns.
15. Assess and limit the client's activity level (anorexia nervosa and bulimia nervosa).
16. Encourage the client to participate in diversional activities.
17. Assess suicide potential.
18. Administer antidepressant medication if prescribed.
19. Encourage psychotherapy.

II. Substance Use Disorders

A. Description: Substance use disorders (addiction) cause behavioral and physiological changes (Box 67.1).
B. Substance dependence
1. Substance dependence is a pattern of repeated use of a substance, which usually results in tolerance, withdrawal symptoms, and compulsive drug-taking behavior.
2. Substances are taken in larger amounts and over longer periods than was intended.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 67.1 CAGE Screening Questionnaire

C Have you ever felt the need to cut down on your drinking/drug use?
A Have you ever been annoyed at criticism of your drinking/drug use?
G Have you ever felt guilty about something that you have done when you have been drinking or taking drugs?
E Have you ever had an eye opener—drinking or taking drugs first thing in the morning to get going or to avoid withdrawal symptoms?

Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 319.

3. There is a desire to cut down, but efforts to decrease or discontinue use are unsuccessful.
4. Daily activities revolve around the use of a substance.

⚠ Screening tools are available to assess a substance use disorder; some are Michigan Alcohol Screening Test (MAST), Drug Abuse Screening Test (DAST), and CAGE screening questionnaire.

C. Substance tolerance is the need for increased amounts of the substance to achieve the desired effect.
D. Substance use
1. Uses substances recurrently
2. Recurrent, significant harmful consequences related to the use of substances are experienced.
3. Involvement with the legal system is common; the client may have legal issues to deal with and resolve.

E. Substance withdrawal
1. Physiological and substance-specific cognitive symptoms occur.
2. Substance withdrawal occurs when an individual experiences a decrease in blood levels of a substance on which the individual is physiologically dependent.

F. Other factors to consider in a client with a substance-related disorder
1. Rebellion and peer group pressure in adolescence may contribute to the onset of substance use.
2. Substance use may become a coping mechanism used to decrease physical and emotional pain.
3. Depression may precede or occur because of an association with substance use.
4. Grief and loss may be associated with substance use.

G. Dysfunctional behaviors related to substance use
1. Preoccupation with obtaining and using substance
2. Manipulation to avoid consequences of behavior
3. Impulsiveness
4. Anger, including physical and verbal abuse
5. Avoidance of relationships outside the family unit
6. Relationships within the family become dysfunctional as the children take on atypical roles to protect the family unit.
7. Sense of self-importance and requiring special treatment
8. Denial—blaming everything but the substance use for problems
9. Use of rationalization and projection to justify unacceptable behavior
10. Low self-esteem
11. Depression
12. Codependency issues
    a. *Codependency* refers to the presence of coexisting behaviors present in a significant other, which serves to enable the addict or alcoholic to continue the irresponsible patterns of use without experiencing consequences.
    b. Examples of codependency: Paying bills for which the addict or alcoholic is responsible, bailing the addict or alcoholic out of jail, and helping the addict or alcoholic to call in sick to employment agency
    c. It is important to address codependency issues with the family to maximize the chance for recovery of the client with the addiction and the person with the codependent behaviors.

III. Alcohol Use Disorders

A. Description
1. Alcohol is a central nervous system (CNS) depressant affecting all body tissues.
2. Physical dependence is a biological need for alcohol to avoid physical withdrawal symptoms, whereas psychological dependence refers to craving for the subjective effect of alcohol.

B. Risk factors
1. Biological predisposition: Genetic and familial predispositions may also be risk factors.
2. Depressed and highly anxious characteristics
3. Low self-esteem
4. Poor self-control
5. History of rebelliousness, poor school performance, and delinquency
6. Poor parental relationships

C. Assessment
1. Slurred speech
2. Uncoordinated movements
3. Unsteady gait
4. Restlessness
5. Confusion
6. Sneaking drinks, drinking in the morning, and experiencing blackouts

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. Binge drinking
8. Arguments about drinking
9. Missing work
10. Increased tolerance to alcohol
11. Intoxication, with blood alcohol content (BAC) of 0.1% (100 mg alcohol/dL blood) or greater (legal BAC may vary state to state)

⚠ Part of the assessment needs to include the type of alcohol, how much, for how long, and when last consumed.

D. Psychological symptoms
1. Depression
2. Irritable, belligerent, and hostile
3. Suspiciousness
4. Rationalization
5. Isolation
6. Decrease in inhibitions
7. Decrease in self-esteem
8. Denial that a problem exists

E. Complications associated with chronic alcohol use
1. Vitamin deficiencies
   a. Vitamin B deficiency, causing peripheral neuropathies
   b. Thiamine deficiency, causing Korsakoff's syndrome
2. Alcohol-induced persistent amnesic disorder, causing severe memory problems
3. Wernicke's encephalopathy, causing confusion, ataxia, and abnormal eye movements
4. **Hepatitis**; **cirrhosis** of the liver
5. Esophagitis and gastritis
6. **Pancreatitis**
7. Anemias
8. Immune system dysfunctions
9. Brain damage
10. Peripheral neuropathy
11. Cardiac disorders

IV. Alcohol Withdrawal

A. Description
1. Abrupt cessation of chronic alcohol use results in central nervous system overactivity.
2. Early signs develop within a few hours after cessation of alcohol intake.
3. These signs peak after 24 to 48 hours and then rapidly disappear unless the withdrawal progresses to alcohol withdrawal delirium.
4. If the withdrawal is not treated, severe and life-threatening symptoms may occur, including seizures and delirium tremens.
5. Withdrawal assessment should be performed using an evidence-based tool, such as the Clinical Institute Withdrawal Assessment of Alcohol Scale (CIWA).

BOX 67.2 Manifestations of Alcohol Withdrawal Delirium (Delirium Tremens)

- Agitation
- Anorexia
- Anxiety
- Delirium
- Diaphoresis
- Disorientation with fluctuating levels of consciousness
- Fever (temperature of 100° F [37.8° C] to 103° F [39.4° C])
- Hallucinations and delusions
- Insomnia
- Tachycardia and hypertension

Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 148.

B. Assessment of alcohol withdrawal symptoms
1. Hypertension and tachycardia
2. Nausea and vomiting
3. Tremors (especially in the hand)
4. Sweating
5. Anxiety
6. Agitation
7. Tactile disturbances (itching, pins and needles sensations, burning, numbness, feeling of bugs crawling on skin)
8. Auditory disturbances (sensitivity to sounds, auditory hallucinations)
9. Visual disturbances (photosensitivity, visual hallucinations)
10. Headache
11. Disorientation

C. Delirium tremens: The state of delirium usually peaks 48 to 72 hours after cessation or reduction of intake (although it can occur later) and lasts 2 to 3 days (Box 67.2).

⚠ Withdrawal delirium is a medical emergency. Death can occur from myocardial infarction, fat emboli, peripheral vascular collapse, electrolyte imbalance, aspiration pneumonia, or suicide.

D. Interventions
1. Administer medications as prescribed.
2. Provide care in a nonjudgmental manner.
3. Check the client frequently.
4. Monitor vital signs and neurological signs (every 15 minutes), and provide one-to-one supervision.
5. Monitor serum electrolytes, including glucose and magnesium.
6. Provide a quiet, nonstimulating environment; encourage a family member (one at a time) to stay with the client to minimize anxiety.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 67.3 Dealing with the Client Who Uses Substances

- Direct the client's focus to the substance use disorder.
- Identify situations that precipitate angry feelings with the client.
- Set limits on manipulative behavior and verbal and physical abuse.
- Hold the client firmly accountable to reasonable limits, consistently reinforcing rules with reasonable consequences for breaking rules.
- Hold the client accountable for all behaviors.
- Use motivational interviewing to assist the client to explore strengths and weaknesses.
- Encourage the client to focus on strengths if the client is losing control.
- Encourage the client to participate in group therapy and support groups.

BOX 67.4 Therapies for Clients with Substance Use Disorder and for Their Families

- Behavioral therapy (including CBT); aversion conditioning with medication
- Hospitalization
- Psychotherapy (individual, group, family)
- 12-step support groups such as Alcoholics Anonymous; Narcotics Anonymous; Pills Anonymous; Al-Anon, Alateen, or Nar-Anon (for family members and friends affected by someone else's addiction); and Adult Children of Alcoholics
- Transitional living programs (halfway houses)

7. Orient frequently.
8. Explain all treatments and procedures in a quiet and simple manner.
9. Initiate seizure precautions.
10. Provide small, frequent, high-carbohydrate foods (administer antiemetic before meals as needed).
11. Monitor intake and output.
12. Assist with activities of daily living, and assist with ambulation if stable.
13. Allow to express fears.

E. Dealing with the client who has a substance use disorder (Boxes 67.3 and 67.4)

V. Drug Dependency

⚠ An overdose of a drug can lead to a toxic condition and death.

A. CNS depressants

1. CNS depressants include alcohol, benzodiazepines, and barbiturates and act as a depressant, sedative, or hypnotic.
2. Intoxication and withdrawal (Table 67.1)
3. Overdose can produce cardiovascular or respiratory depression, coma, shock, seizures, and death.
4. Overdose: If the client is awake, vomiting is induced and activated charcoal is administered; if the client is comatose, establishment and maintenance of an airway and gastric lavage with activated charcoal are the priorities; seizure precautions are indicated.
5. Flumazenil intravenously may be used for benzodiazepine overdose to reverse the effects.
6. Withdrawal must be treated with a carefully titrated similar drug (abrupt withdrawal can lead to death).
7. Withdrawal from CNS depressants such as barbiturates is generally treated with a barbiturate such as phenobarbital or a long-acting benzodiazepine.

B. CNS stimulants

1. CNS stimulants include substances such as amphetamines, cocaine, and crack.
2. Intoxication and withdrawal (see Table 67.1)
3. Overdose can produce respiratory distress, ataxia, hyperpyrexia, seizures, coma, stroke, myocardial infarction, and death.
4. Overdose is treated with antipsychotics and management of associated effects.
5. Withdrawal is treated with antidepressants, a dopamine agonist, or bromocriptine; withdrawal is primarily supportive, particularly when dealing with the severe depression and suicidal ideation that accompanies stimulant withdrawal.

C. Opioids

1. Include substances such as opium, heroin, meperidine, morphine, codeine sulfate, methadone, hydromorphone, oxycodone, hydrocodone, and fentanyl
2. Intoxication and withdrawal (see Table 67.1)
3. Overdose can produce respiratory depression, shock, coma, seizures, and death (Box 67.5).
4. Withdrawal assessment should be performed using an evidence-based tool, such as the Clinical Opiate Withdrawal Scale (COWS).
5. Withdrawal assessment (see Clinical Judgment: Recognize Cues box)

D. Hallucinogens

1. Hallucinogens include substances such as lysergic acid diethylamide (LSD), mescaline (peyote), psilocybin (mushrooms), and phencyclidine (PCP).

Telegram & Insta: NCLEX_RN_Edu

TABLE 67.1 Signs and Symptoms of Intoxication and Withdrawal of Various Substances

Substance	Intoxication	Withdrawal
CNS depressants	▪ Drowsiness ▪ Hypotension ▪ Impairment of memory, attention, judgment ▪ Unsteady gait ▪ Irritability ▪ Slurred speech	▪ Nausea and vomiting ▪ Tachycardia ▪ Diaphoresis ▪ Anxiety and irritability; tremors ▪ Insomnia ▪ Seizures
CNS stimulants	▪ Dilated pupils ▪ Euphoria ▪ Hypertension and tachycardia ▪ Impaired judgment ▪ Insomnia ▪ Paranoia, delusions, hallucinations ▪ Agitation ▪ Cardiac dysrhythmias	▪ Fatigue ▪ Vivid nightmares ▪ Insomnia ▪ Hypersomnia ▪ Anxiety and agitation ▪ Depression and suicidal ideations
Opioids	▪ Constricted pupils ▪ Bradypnea ▪ Drowsiness ▪ Hypotension ▪ Impaired memory and attention ▪ Psychomotor retardation ▪ Slurred speech	▪ Tachycardia ▪ Diaphoresis ▪ Restlessness ▪ Dilated pupils ▪ Body aches ▪ Rhinorrhea and lacrimation ▪ Diarrhea and vomiting ▪ Tremors ▪ Yawning ▪ Anxiety and irritability ▪ Piloerection
Hallucinogens	▪ Agitation and belligerence ▪ Anxiety ▪ Bizarre or violent behavior ▪ Blank stare ▪ Diaphoresis ▪ Elevated vital signs ▪ Hallucinations ▪ Incoordination ▪ Muscular rigidity and chronic jerking ▪ Paranoia ▪ Tremors and seizures	▪ Irritability and agitation ▪ Anxiety ▪ Mood changes ▪ Headaches ▪ Insomnia ▪ Difficulty concentrating
Inhalants	▪ Enhancement of sexual pleasure ▪ Euphoria ▪ Excitation followed by drowsiness, disinhibition, and agitation ▪ Delirium and psychosis	▪ Irritability and agitation ▪ Anxiety ▪ Mood changes ▪ Headaches ▪ Insomnia ▪ Difficulty concentrating
▪ Marijuana (cannabis)	▪ Heightened sensations ▪ Depersonalization ▪ Red eyes ▪ Increased appetite ▪ Dry mouth ▪ Tachycardia	▪ Irritability and agitation ▪ Anxiety ▪ Mood changes ▪ Disturbing dreams ▪ Headache

BOX 67.5 Opioid Overdose Crisis

Both the United States and Canada are facing a national opioid overdose crisis that continues to have devastating impacts on the person, family, and the community.

Risk factors for opioid use include but are not limited to:

- History of Opioid Use Disorder (OUD)
- Previous opioid overdose or intoxication
- History of nonmedical opioid use
- High cumulative doses of opioids (multiple long and/or short acting)
- Prescribed respiratory depressing medications (i.e., benzodiazepines)
- Underlying respiratory conditions (i.e., asthma, emphysema, sleep apnea, COPD, cystic fibrosis, etc.)
- Known or suspected concurrent alcohol use

Nurses' and prescribers' role in verifying legitimacy and appropriateness of opioid medications:

- An interprofessional approach among clients, nurses, prescribers, and pharmacists in monitoring appropriate use of opioids is needed, and applicable state or federal regulations need to be followed
- Nurses and prescribers need to use check lists and screening tools, such as the Opioid Risk Tool (ORT), and ensure other required documentation is in place and updated accordingly.
- Common required documentation includes a prescriber checklist, informed consent, a medication agreement, prescriptions with all required elements (ie. diagnosis code, Drug Enforcement Administration (DEA) number, supply, signature, 2-step verification for electronic prescribing), and documentation of checking a prescription monitoring program.

Pharmacists' role in verifying legitimacy and appropriateness of opioid medications:

- When performing evaluation on whether an opioid medication prescription is appropriate, pharmacists must identify if the prescription has any red flag alerts
- Some examples are included below; however, it is not an exhaustive list and pharmacists can and will use their professional judgment and experience to identify if any potential issues exist
- Is the prescription written in the prescriber's usual course of practice?
  - Pharmacists must determine if the prescription is written outside the usual course of practice/specialty.
  - Pharmacists must determine if there are unusual geographical distances between the client, pharmacy and/or prescriber that cannot be reasonably explained.
  - Does the prescription appear to be issued pursuant to a legitimate client/prescriber relationship and not issued by an online questionnaire website or similar entity?
  - Are there therapeutic duplications of multiple long and/or short acting opioids?
- Prescriptions
  - Is there an unusual dosage, directions, or quantities beyond what is normally prescribed?
  - Are there dose/directions that conflict with approved labeling?
  - Are there frequent combinations for known drug "cocktails" such as benzodiazepine, opioid, and muscle relaxers?
  - Is there an increased frequency of prescriptions for same or similar medications?
  - Does the physical appearance of the hard copy prescription appear to be altered, forged, or contain grammatical errors?
  - Does the prescription contain atypical abbreviations or medical shorthand?
  - Does the prescription have an unusual presentation – handwriting too legible, different colored inks, multiple handwriting styles, etc.?
  - Is the prescription being presented for early refill without explanation and/or pattern of early fills?
  - Does the prescription show signs of being rejected by another pharmacist?
- Clients
  - Is the client consistently requesting early refills?
  - Is the client exhibiting "drug seeking" type behaviors (e.g., manipulative and/or demanding behavior to obtain medication)?
  - Does the client travel long distances that cannot be explained?
  - Does the client's medication history show only controlled substances?
  - Does the client request to pay by cash (i.e., no third party billing) in an effort to circumvent billing restrictions?
  - Are there controlled substance prescriptions from many different prescribers and/or using many different pharmacies?
  - Does the client present intoxicated or under the influence of recreational drugs?
- Prescribers
  - Is the prescriber unwilling to provide diagnosis codes and/or letter of medical necessity for chronic opioid treatment?
  - Is the prescriber unwilling to partner with pharmacy to provide necessary documentation?

Opioid antagonists

- The pharmacy may proactively identify if an opioid antagonist may be beneficial for clients on opioid medications.
- Many states have standing orders that allow pharmacists to dispense these prescription-only medications to clients or caregivers using their professional judgment.
- All healthcare providers should be aware of and/or consider the use of these medications in clients at risk for opioid overdose. Current available options: Naloxone nasal spray

Telegram & Insta: NCLEX_RN_Edu

CLINICAL JUDGMENT: RECOGNIZE CUES

The nurse is monitoring a client in a psychiatric mental health facility. The client is receiving treatment for opioid addiction, and the nurse monitors for signs of withdrawal. The nurse *recognizes cues* associated with opioid withdrawal when the following assessment findings are noted: tachycardia, diaphoresis, restlessness, dilated pupils, bone and joint aches, rhinorrhea and lacrimation, diarrhea and vomiting, tremors, yawning, anxiety or irritability, and piloerection.

2. Intoxication and withdrawal (see Table 67.1)
3. If an overdose of these substances occur, serious health problems can result. Overdose effects of LSD, peyote, and psilocybin include psychosis, brain damage, and death; overdose effects of PCP include psychosis, hypertensive crisis, hyperthermia, seizures, and respiratory arrest.
4. Treatment (LSD, peyote, psilocybin) involves low environmental stimuli (speak slowly, clearly, and in a low voice) and medications to treat anxiety.
5. Treatment (PCP) involves possible gastric lavage (if alert); treatment to acidify the urine to assist in excreting the drug; and interventions to treat behavioral disturbances, hyperthermia, hypertension, and respiratory distress.
6. Management of withdrawal is primarily supportive and may include medications to target particular problem behaviors, such as agitation.

Flashbacks, which are unexpected reexperiences of the effects of a hallucinogenic drug, can occur for extended periods of time after the drug's original use. Safety during flashbacks is a priority.

E. Inhalants
1. Inhalants include gases or liquids such as butane, paint thinner, paint and wax removers, airplane glue, nail polish remover, and nitrous oxide.
2. Intoxication and withdrawal (see Table 67.1)
3. Overdose can cause damage to the nervous system and death.
4. Management of withdrawal is mainly supportive, including the treatment of affected body systems.

F. Marijuana (*Cannabis sativa*)
1. Generally is smoked, but can be ingested. It may be legally prescribed in certain states, and in some states and provinces, it is legal without a prescription.
2. Intoxication and withdrawal (see Table 67.1)
3. Long-term dependence can result in lethargy, amotivation syndrome, difficulty concentrating, memory loss, and possibly chronic respiratory disorders.
4. Withdrawal management is mainly supportive.

G. Other recreational and club drugs

There are many types of illegal street drugs that are harmful. The nurse needs to be knowledgeable about the physiological effects of these various drugs, be able to recognize the signs associated with their use, and be prepared to provide immediate treatment.

1. Can include methylenedioxymethamphetamine (MDMA, ecstasy), γ-hydroxybutyrate (GHB), methamphetamine (crack, meth, crystal meth), and ketamine (special K)
2. Effects include euphoria, increased energy, increased self-confidence, and increased sociability.
3. Adverse effects include hyperthermia, rhabdomyolysis, kidney failure, hepatotoxicity, depression, panic attacks, psychosis, cardiovascular collapse, and death.
4. Programs for addiction also address nicotine withdrawal and the pharmacological and psychotherapeutic interventions for this problem, such as nicotine patches, nicotine inhalers, and bupropion for the reduction of withdrawal symptoms and cravings.
5. Anabolic steroids have also gained increased attention as increasingly adverse events, including death, have become more widely publicized.

H. Interventions: Withdrawal (Box 67.6)
1. Initiate seizure precautions.
2. Hydrate the client.
3. Monitor vital signs every hour; include cardiac monitoring and diagnostic tests such as electrocardiogram and cardiac markers because of the risk of cardiac damage with certain drugs.
4. Monitor intake and output.
5. Orient the client frequently.
6. Maintain minimal stimuli.
7. Approach the client in an accepting and nonjudgmental manner.
8. Direct focus to the substance use problem.
9. Assist the client with identifying situations that precipitate angry feelings.
10. Assist the client to deal with emotions.
11. Limit placing blame or rationalizing to explain the substance use problem.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 67.6 Withdrawal: Nursing Care

- Obtain information regarding the type of drug and amount consumed.
- Assess vital signs.
- Remove unnecessary objects from the environment.
- Provide one-to-one supervision if necessary.
- Provide a quiet, calm environment with minimal stimuli.
- Maintain client orientation.
- Ensure the client's safety by implementing seizure precautions.
- Use security devices if necessary and as prescribed to prevent the client from harming self and others.
- Provide for physical needs.
- Provide food and fluids as tolerated.
- Administer medications as prescribed to decrease withdrawal symptoms.
- Collect blood and urine samples for drug screening.

Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. p. 206; Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 148.

12. Assist the client to use assertive techniques rather than manipulation to meet needs.
13. Set limits on manipulative behavior and verbal and physical use.
14. Maintain firm and reasonable limits, consistently reinforcing rules with reasonable consequences for breaking rules.
15. Hold the client accountable for all behaviors.
16. Assist the client to explore strengths and weaknesses.
17. Encourage the client to focus on strengths if the client is losing control.
18. Encourage the client to participate in unit activities.
19. Encourage the client to participate in group therapy and support groups.

I. Dual diagnoses
1. Sometimes the use of alcohol and drugs masks underlying psychiatric pathology.
2. Psychiatric pathology may also be precipitated by substance use.
3. When psychiatric disorders and substance use are present together, it is often referred to as *dual diagnosis.*
4. Separating psychiatric diagnosis from substance dependence can be done only over time after a sustained period of abstinence.

J. Addiction and substance use in health care professionals: Suspicious signs
1. Frequently reporting that drugs have been wasted without being witnessed by another nurse
2. Reporting the administration of maximum dosages of controlled substances to clients when other nurses do not administer the maximum dose
3. A variance in usual pain relief in their clients in the absence of a change in dosage or frequency of administration
4. Work patterns include the following: Always volunteering to carry narcotic (opioids) keys (or other opioid access devices per agency procedure); choosing shifts in which less supervision is present; choosing work areas where the use of controlled substances is high, such as critical care units, operating room, anesthesia, and trauma units.
5. Nurses have a professional and ethical obligation to report impaired coworkers.
6. Most impaired nurses can return to work through the State Board of Nursing assistance and monitoring programs; such programs usually require strict adherence to clearly stated rules and regular reports and drug screens.

PRACTICE QUESTIONS

1. The home health nurse visits a client at home and determines that the client is dependent on drugs. During the assessment, which action would the nurse take to plan appropriate nursing care?
   1. Ask the client why they started taking illegal drugs.
   2. Ask the client about the amount of drug use and its effect.
   3. Ask the client how long they thought that they could take drugs without someone finding out.
   4. Not ask any questions for fear that the client is in denial and will throw the nurse out of the home.

2. Which interventions are **most appropriate** for caring for a client in alcohol withdrawal? **Select all that apply.**
   - ❑ 1. Monitor vital signs.
   - ❑ 2. Provide a safe environment.
   - ❑ 3. Address hallucinations therapeutically.
   - ❑ 4. Provide stimulation in the environment.
   - ❑ 5. Provide reality orientation as appropriate.
   - ❑ 6. Maintain NPO (nothing by mouth) status.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

3. The nurse determines that the spouse of an alcoholic client is benefiting from attending an Al-Anon group if the nurse hears the spouse make which statement?
   1. "I no longer feel that I deserve the beatings my partner inflicts on me."
   2. "My attendance at the meetings has helped me to see that I provoke my partner's violence."
   3. "I enjoy attending the meetings because they get me out of the house and away from my partner."
   4. "I can tolerate my partner's destructive behaviors now that I know they are common among alcoholics."

4. A hospitalized client with a history of alcohol use disorder tells the nurse: "I am leaving now. I must go. I do not want any more treatment. I have things that I have to do right away." The client has not been discharged and is scheduled for an important diagnostic test to be performed in 1 hour. After the nurse discusses the client's concerns with the client, the client dresses and begins to walk out of the hospital room. What action would the nurse take?
   1. Call the nursing supervisor.
   2. Call security to block all exit areas.
   3. Restrain the client until the primary health care provider (PHCP) can be reached.
   4. Tell the client that the client cannot return to this hospital again if the client leaves now.

5. The nurse is preparing to perform an admission assessment on a client with a diagnosis of bulimia nervosa. Which assessment findings would the nurse expect to note? **Select all that apply.**
   - ❑ 1. Dental decay
   - ❑ 2. Moist, oily skin
   - ❑ 3. Loss of tooth enamel
   - ❑ 4. Electrolyte imbalances
   - ❑ 5. Body weight well below ideal range

6. The nurse is caring for a client who was admitted to the mental health unit recently for anorexia nervosa. The nurse enters the client's room and notes that the client is engaged in rigorous push-ups. Which nursing action is **most appropriate?**
   1. Allow the client to complete the exercise program.
   2. Interrupt the client and weigh the client immediately.
   3. Tell the client that exercising rigorously is not allowed.
   4. Interrupt the client and offer to take the client for a walk.

7. A client with a diagnosis of anorexia nervosa, who is in a state of starvation, is in a two-bed room. A newly admitted client will be assigned to this client's room. Which client would be the **best** choice as a roommate for the client with anorexia nervosa?
   1. A client with pneumonia
   2. A client undergoing diagnostic tests
   3. A client who thrives on managing others
   4. A client who could benefit from the client's assistance at mealtime

8. The nurse is assessing a client who was admitted 24 hours ago for a fractured humerus. Which findings would alert the nurse to the potential for alcohol withdrawal delirium?
   1. Hypotension, ataxia, hunger
   2. Stupor, lethargy, muscular rigidity
   3. Hypotension, coarse hand tremors, lethargy
   4. Hypertension, changes in level of consciousness, hallucinations

9. The spouse of a client admitted to the mental health unit for alcohol withdrawal says to the nurse, "I need to get out of this bad situation." Which is the **most** helpful response by the nurse?
   1. "Why don't you tell your spouse about this?"
   2. "What do you find difficult about this situation?"
   3. "This is not the best time to make that decision."
   4. "I agree with you. You should get out of this situation."

10. A client with anorexia nervosa is a member of a predischarge support group. The client verbalizes an interest in buying new clothes, but expresses that money is limited. Group members have brought some used clothes to the client to replace the client's old clothes. The client believes that the new clothes are much too tight and has reduced personal caloric intake to 800 calories daily. How would the nurse evaluate this behavior?
    1. Normal behavior
    2. Evidence of the client's disturbed body image
    3. Regression as the client is moving toward the community
    4. Indicative of the client's ambivalence about hospital discharge

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

ANSWERS

1. *Answer:* 2

Rationale: Whenever the nurse carries out an assessment for a client who is dependent on drugs, it is best for the nurse to attempt to elicit information by being nonjudgmental and direct. Option 1 is incorrect because it is judgmental and off-focus, and reflects the nurse's bias. Option 3 is incorrect because it is judgmental, insensitive, and aggressive, which is nontherapeutic. Option 4 is incorrect because it indicates passivity on the nurse's part and uses rationalization to avoid the therapeutic nursing intervention.

Test-Taking Strategy: Focus on the **subject,** providing appropriate nursing care. Use of **therapeutic communication techniques** will assist in directing you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93, 318-319.

2. *Answer:* 1, 2, 3, 5

Rationale: When the client is experiencing withdrawal from alcohol, the priority for care is to prevent the client from harming self or others. The nurse would monitor the vital signs closely and report abnormal findings. The nurse would provide a low-stimulation environment to maintain the client in as calm a state as possible. The nurse would reorient the client to reality frequently and would address hallucinations therapeutically. Adequate nutritional and fluid intake needs to be maintained.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Thinking about the needs of the client in alcohol withdrawal and recalling the characteristics associated with alcohol withdrawal will assist in answering correctly. Also, use **therapeutic communication techniques** to assist in selecting the correct interventions.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93, 310-311.

3. *Answer:* 1

Rationale: Al-Anon support groups are a protected, supportive opportunity for spouses and significant others to learn what to expect and to obtain excellent pointers about successful behavioral changes. The correct option is the healthiest response because it exemplifies an understanding that the alcoholic partner is responsible for their own behavior and cannot be allowed to blame family members for loss of control. Option 2 is incorrect because the nonalcoholic partner should not feel responsible when the spouse loses control. Option 3 indicates that the group is viewed as an escape, not as a place to work on issues. Option 4 indicates that the nonalcoholic partner remains codependent.

Test-Taking Strategy: Focus on the **subject,** the therapeutic effect of attending an Al-Anon group. Noting the words *benefiting from attending an Al-Anon group* will direct you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 326.

4. *Answer:* 1

Rationale: Most health care facilities have documents that the client is asked to sign relating to the client's responsibilities when the client leaves against medical advice. The client would be asked to wait to speak to the PHCP before leaving and to sign the "against medical advice" document before leaving. If the client refuses to do so, the nurse cannot hold the client against the client's will. Therefore, in this situation, the nurse would call the nursing supervisor. The nurse can be charged with false imprisonment if clients are made to believe wrongfully that they cannot leave the hospital. Restraining the client and calling security to block exits constitutes false imprisonment. All clients have a right to health care and cannot be told otherwise.

Test-Taking Strategy: Keeping the concept of false imprisonment in mind, eliminate options 2 and 3 because they are **comparable or alike.** Eliminate option 4, knowing that all clients have a right to health care. From the options presented, the best action is presented in the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 63; Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends.* (10th ed.). St. Louis: Elsevier. p. 468.

5. *Answer:* 1, 3, 4

Rationale: Clients with bulimia nervosa initially may not appear to be physically or emotionally ill. They are often at or slightly below ideal body weight. On further inspection, a client exhibits dental decay and loss of tooth enamel if the client has been inducing vomiting. Electrolyte imbalances are present. Dry, scaly skin (rather than moist, oily skin) is present.

Test-Taking Strategy: Focus on the **subject,** assessment findings in bulimia nervosa. It is necessary to recall that in anorexia nervosa the body weight is normally well below ideal body weight and that clients with bulimia nervosa are often at or slightly below ideal body weight. Also, remember that skin texture will be dry and scaly.

References: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 187, 192-193.

6. *Answer:* 4

Rationale: Clients with anorexia nervosa frequently are preoccupied with rigorous exercise and push themselves beyond normal limits to work off caloric intake. The nurse must provide for appropriate exercise and place limits on rigorous activities. The correct option stops the harmful behavior yet provides the client with an activity to decrease anxiety that is not harmful. Weighing the client immediately reinforces the client's preoccupation with weight. Allowing the client to complete the exercise program can be harmful to the client. Telling the client that completing the exercise is not allowed will increase the client's anxiety.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and focus on the client's diagnosis. Also, focus on the need for the nurse to maintain safety and to set firm limits with clients who have this disorder.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 189-190.

7. *Answer:* 2
Rationale: The client undergoing diagnostic tests is an acceptable roommate. The client with anorexia nervosa is most likely experiencing hematological complications, such as leukopenia. Having a roommate with pneumonia would place the client with anorexia nervosa at risk for infection. The client with anorexia nervosa should not be put in a situation in which the client can focus on the nutritional needs of others or be managed by others because this may contribute to sublimation and suppression of personal hunger.
Test-Taking Strategy: Note the **strategic word**, *best*, and note the words *in a state of starvation* in the question. Recalling the characteristics of anorexia nervosa and that the client is immunocompromised as a result of starvation will direct you to the correct option.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 188.

8. *Answer:* 4
Rationale: Symptoms associated with alcohol withdrawal delirium typically include hypertension, tachycardia, nausea and vomiting, tremors (especially in the hand), sweating, anxiety, agitation, tactile disturbances, hallucinations such as auditory or visual disturbances, headache, and disorientation.
Test-Taking Strategy: Focus on the **subject,** findings associated with withdrawal delirium. Review each option carefully to ensure that all symptoms in the option are correct. Eliminate options 1 and 3 first, knowing that hypertension rather than hypotension occurs. From the remaining options, recalling that the client who is stuporous is unlikely to exhibit withdrawal delirium will direct you to the correct option.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 310-311.

9. *Answer:* 2
Rationale: The most helpful response is one that encourages the client to solve problems. Giving advice implies that the nurse knows what is best and can foster dependency. The nurse would not agree with the client, and the nurse would not request that the client provide explanations.
Test-Taking Strategy: Note the **strategic word,** *most*. Use **therapeutic communication techniques.** Eliminate option 1 because of the word *why*, which should be avoided in communication. Eliminate option 3 because this option places the client's feelings on hold. Eliminate option 4 because the nurse is agreeing with the client. The correct option is the only one that addresses the client's feelings.
References: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. pp. 113, 204; Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Elsevier. pp. 93-95.

10. *Answer:* 2
Rationale: Disturbed body image is a concern with clients with anorexia nervosa. Although the client may struggle with ambivalence and show regressed behavior, the client's coping pattern relates to the basic issue of disturbed body image. The nurse should address this need in the support group.
Test-Taking Strategy: Note the **subject,** signs of disturbed body image. Note the relationship between the information in the question and the correct option.
Reference: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. pp. 257-258.

CHAPTER 68

Crisis Theory and Intervention

Contributor: Michael Johnson, PhD, RN, PMH-BC, CNE

Telegram & Insta: NCLEX_RN_Edu

PRIORITY CONCEPTS Coping; Interpersonal Violence

I. Crisis Intervention

A. Description
- **1.** Crisis is a temporary state of severe emotional disorganization caused by an event that presents a threat.
- **2.** Everyone experiences crises; the outcome depends on coping mechanisms and support systems available at the time of the crisis.
- **3.** The ability for decision-making and problem-solving is inadequate.
- **4.** Treatment is aimed at assisting the client and the family through the stressful situation.

B. Phases of a crisis
- **1.** Phase 1: External precipitating event (could be situational, developmental, cultural, or societal)
- **2.** Phase 2
  - **a.** Perception of the threat
  - **b.** Increase in anxiety
  - **c.** Client may cope or resolve the crisis.
- **3.** Phase 3
  - **a.** Failure of coping
  - **b.** Increasing disorganization
  - **c.** Emergence of physical symptoms
  - **d.** Relationship problems
- **4.** Phase 4
  - **a.** Mobilization of internal and external resources
  - **b.** Goal is to return the client to at least a precrisis level of functioning.

C. Types of crises (Box 68.1)

D. Crisis intervention
- **1.** Treatment is immediate, supportive, and directly responsive to the immediate crisis.
- **2.** The interprofessional health care team assists individuals in crisis to cope; interventions are goal directed.
- **3.** Feelings of the client are acknowledged.
- **4.** Intervention provides opportunities for expression and validation of feelings.
- **5.** Connections are made between the meaning of the event and the crisis.
- **6.** The client explores alternative coping mechanisms and tries out new behaviors.

II. Grief

A. Grief is a natural emotional response to loss that individuals must experience as they attempt to accept the loss.

B. Grief usually involves moving through a series of stages or tasks to help resolve the grief (Box 68.2).

C. Depending on the type of loss, feelings associated with grief include anger, frustration, loneliness, sadness, guilt, regret, and peace.

D. Healing can occur when the pain of the loss has lessened and the individual has adapted to the loss; if the grief is the result of the loss of a loved one, the individual continues to experience memories of the deceased.

E. Types of grief
- **1.** Normal grief: Physical, emotional, cognitive, spiritual, or behavioral reactions can occur; the process of resolution can take months to years.
- **2.** Anticipatory grief occurs before the loss of a loved one and is associated with an acute, chronic, or terminal illness.
- **3.** Disenfranchised grief occurs when the loss of a loved one is experienced but cannot be acknowledged openly (societal norms do not define the loss as a loss within its traditional definition).
- **4.** Dysfunctional grief occurs with prolonged emotional instability and a lack of progression to successful coping with the loss.
- **5.** Grief in children is based on the developmental level of the child (Box 68.3).

III. Loss

A. Loss is the absence of something desired or previously thought to be available.

Telegram & Insta: NCLEX_RN_Edu

BOX 68.1 Types of Crises

Maturational

- Relates to developmental stages and associated role changes; examples include marriage, birth of a child, and retirement

Situational

- Arises from an external source, is often unanticipated, and is associated with a life event that upsets an individual's or group's psychological equilibrium; examples include loss of a job or a change in job, change in financial status, death of a loved one, divorce, abortion, addition of new family members, pregnancy, and severe physical or mental illness

Adventitious

- Relates to a crisis or disaster, is not a part of everyday life; it is unplanned and accidental. Adventitious crises may result from a natural disaster (e.g., floods, fires, tornadoes, earthquakes), a national disaster (e.g., war, riots, airplane crashes), or a crime of violence (e.g., rape, assault, murder in the workplace or school, bombings, or spousal or child abuse).

From Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 332-333.

BOX 68.2 The Grief Response

Stage 1: Shock and Disbelief

- Individuals may have feelings of numbness, difficulties with decision-making, emotional outbursts, denial, and isolation.

Stage 2: Experiencing the Loss

- If the grief response is the result of the loss of a loved one, the individual may feel angry at the loved one who died or may feel guilt about the death.
- Bargaining or depression or both also may occur in this stage.

Stage 3: Reintegration

- Individuals begin to reorganize their lives and accept the reality of the loss.

B. Actual loss can be identified by others and can arise in response to or in anticipation of a situation.

C. Perceived loss is experienced by one person and cannot be verified by others.

D. Anticipatory loss is experienced before the loss occurs.

E. Mourning

1. Mourning is the outward and social expression of loss.
2. Mourning may be dictated by cultural, spiritual, and religious beliefs.

BOX 68.3 Grief in Children

Birth to 1 Year

- Infant has no concept of death.
- Infant reacts to the loss of parent or caregiver.

1 to 2 Years

- Toddler may see death as reversible.
- Toddler may scream, withdraw, or become disinterested in the environment.
- Grief response occurs only to the death of the significant person in the toddler's life.

2 to 5 Years

- Child may see death as reversible.
- Regressive or aggressive behavior may occur.
- Child has a sense of loss and is concerned about who will provide care.

5 to 9 Years

- Child has difficulty concentrating.
- Child begins to see death as permanent.
- Child may feel responsible for the occurrence.

Preadolescent Through Adolescent

- Adolescent may regress.
- Adolescent sees death as permanent.
- Adolescent experiences a strong emotional reaction.

F. Bereavement

1. Bereavement includes the inner feelings and the outward reactions of the individual experiencing the loss.
2. Bereavement includes grief and mourning.

IV. Nurse's Role: Grief and Loss (Box 68.4)

A. Encourage the client to express feelings within a trusting, supportive, and nonjudgmental environment.

B. Allow ongoing opportunities for fully informed choices.

C. Facilitate the grief process; assess the individual's grief, and assist the individual to feel the loss and complete the tasks of the grief process.

D. Grief affects individuals physically, psychologically, socially, and spiritually; an interprofessional team approach, including a bereavement specialist, facilitates the grief process.

The nurse's role in the grief and loss process includes communicating with the client, family members, and significant other. The nurse must consider the individual's culture, spirituality, religion, family structure, life experiences, coping skills, and support systems.

V. COVID-19 Coping

A. Description

1. The unprecedented event of the COVID-19 pandemic, along with its emotional effect of acute

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 68.4 Communication During Grief and Loss

- Determine how much the client and family want to know about the situation.
- Determine whether there is a spokesperson for the family.
- Be aware of cultural, spiritual, and religious beliefs and how they may affect the communication process; consider personal space issues, eye contact, and touch.
- Obtain an interpreter, if necessary.
- Allow opportunity for informed choices.
- Assist with the decision-making process if asked; use problem-solving to assist in decision-making, and avoid interjecting personal views or opinions.
- Establish trust with the client and encourage expression of feelings, concerns, and fears within a trusting, supportive, and nonjudgmental environment.
- Be honest, and let the client and family know that you will not abandon them.
- Ask the client and family about their expectations and needs.
- Be a sensitive listener; sit in silence if necessary and appropriate.
- Extend touch and hold the client's or family member's hand if appropriate.
- Encourage reminiscing.
- If you do not know what to do in a particular situation, seek assistance.
- If you do not know what to say to a family or client who is talking about death or another loss, listen attentively and use therapeutic communication techniques, such as open-ended questions or reflection.
- Acknowledge your own feelings; let the client and family know that the topic of conversation is a difficult one and that you do not know what to say.
- Realize that it is acceptable to cry with the client and family during the grief process.

traumatic stress, has affected everyone and is in essence a direct threat to our lives.

2. The normal way of life has changed, and it is unknown whether life will ever go back to normal or be the same.
3. It is crucial that nurses recognize that the pandemic is a real threat to both physical and emotional well-being and that coping methods need to be in place to prevent prolonged psychological effects, such as depression or post-traumatic stress disorder or other types of emotional distress.
4. Supportive relationships are key in promoting resilience and healing from trauma.
5. Moral injury is a concern, particularly among health care workers who need to make difficult and even impossible choices during care and end up feeling responsible for the deaths of others.
6. Family members and friends may suffer from moral injury when witnessing upsetting situations, such as when a loved one becomes ill and they face the impossibility of being with the loved one or helping the loved one.
7. Grief and loss are experienced. There may be a communal sense of grief because of the loss of how things were and anticipatory grief related to the threat of loss of life. Many experience the loss of jobs or financial losses. (Refer to Section IV for additional information on grief and loss.)
8. Each individual's experience with grief and loss will differ, and it is crucial for the nurse to understand this and accept the differences.

B. Assessment

1. Anxiety
2. Feelings of panic
3. Fear of the unknown and what the future will bring
4. Psychological stress of isolation and quarantine
5. Grief and loss: Apathy, insomnia, change in appetite, weight changes, anxiety, anger, irritability, sadness, worries, numbness
6. Depression and other emotional effects, including **suicide**
7. Survival guilt

C. Interventions for coping

1. Assess the client for signs of psychological stress and the effects of grief and loss.
2. Assess for signs of depression and suicidal behaviors; intervene as necessary and appropriate.
3. Provide hope and foster resilience with the client and family.
4. Encourage the use of cognitive reappraisal approaches; assist the client to approach stressors with a positive view and emphasize that resources are available; encourage breathing techniques.
5. Encourage the client to think about and list what one can control.
6. Promote the use of safety behaviors, such as physical distancing, handwashing, and wearing masks; these decrease transmission of the virus and are a part of managing anxiety.
7. Limit media exposure related to COVID, and avoid forwarding fearful media information to others.
8. Continue to seek connectedness and social support from family and friends via text, video methods, phone, or email; it is comforting to know that others are doing well.
9. Encourage clients to care for themselves by eating well, engaging in activities and exercise, and getting adequate sleep.
10. Encourage clients to seek out resources that assist in support and offer ways to cope with related traumatic stress, grief, and loss.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

VI. Suicidal Behavior

A. Description
1. Suicidal clients characteristically have feelings of worthlessness, guilt, and hopelessness that are so overwhelming that they feel unable to go on with life and feel unfit to live.
2. The nurse caring for a depressed client always considers the possibility of **suicide.**

B. Individuals at risk
1. Clients with a history of previous **suicide attempts**
2. Family history of suicide attempts
3. Adolescents
4. Older adults
5. Disabled or terminally ill clients
6. Clients with personality disorders
7. Clients with organic brain syndrome or dementia
8. Depressed or psychotic clients (see Chapter 66 for information on depression)
9. Substance abusers
10. Those who have been consistently bullied or rejected by peers or society
11. History of child maltreatment
12. Past psychiatric hospitalizations

C. Cues (Box 68.5)

D. Assessment (Box 68.6)

E. Interventions
1. Assess for suicidal intent or ideation, and initiate suicide precautions.
2. The client's statements, behaviors, and mood are documented every 15 minutes.
3. Remove harmful objects.
4. Do not leave the client alone.
5. Provide a nonjudgmental, caring attitude.
6. Encourage the client to talk about feelings and to identify positive aspects about self.
7. Encourage active participation in own care.
8. Keep the client active by assigning achievable tasks.
9. Check that visitors do not leave harmful objects in the client's room.
10. Identify support systems.
11. Do not allow the client to leave the unit unless accompanied by a staff member.
12. Continue to assess the client's suicide potential.

! Provide one-to-one supervision at all times for the client at risk for suicide.

VII. Abusive Behaviors

A. Anger
1. Anger is a feeling of annoyance that may be displaced onto an object or person.
2. Anger is used to avoid anxiety and gives a feeling of power in situations in which the person feels out of control.

BOX 68.5 Suicidal Cues

- Giving away personal, special, and prized possessions
- Canceling social engagements
- Making out or changing a will
- Taking out or changing insurance policies
- Positive or negative changes in behavior
- Poor appetite
- Sleeping difficulties
- Feelings of hopelessness
- Difficulty in concentrating
- Loss of interest in activities
- Client statements indicating an intent to attempt suicide
- Sudden calmness or improvement in a depressed client
- Client inquiries about poisons, guns, or other lethal items or objects
- Sudden deterioration in school/work performance

BOX 68.6 Suicidal Client: Assessment

Plan
- Does the client have a plan?
- Does the client have the means to carry out the plan?
- Has the client decided when to carry out the plan?

Client History of Attempts
- What suicide attempts occurred in the past and what harm occurred?
- Was the client accidentally rescued?
- Have the past attempts and methods been the same, or have methods increased in lethality?

Psychosocial Factors
- Is the client alone or alienated from others?
- Is hostility or depression present?
- Is the client experiencing hallucinations? Type of hallucination (audio/command, visual)?
- Is substance abuse present?
- Has the client had any recent losses or physical illness?
- Has the client had any environmental or lifestyle changes?

B. Aggression can be harmful and destructive when not controlled.

C. Violence is physical force that is threatening to the safety of self and others.

D. Assessment
1. History of violence or self-harm
2. Poor impulse control and low tolerance of frustration
3. Defiant and argumentative
4. Raising of voice
5. Making verbal threats
6. Pacing and agitation
7. Muscle rigidity
8. Flushed face
9. Glaring at others

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

E. Interventions
1. Ensure a safe and low stimuli environment.
2. Use a calm approach and communicate with a calm, clear tone of voice (be assertive, not aggressive, and avoid verbal struggles).
3. Maintain a large personal space and use a nonaggressive posture (e.g., arms and hands at the side rather than folded across the chest or placed on the hips).
4. Listen actively and acknowledge the client's anger.
5. Determine what the client considers to be personal needs.
6. Provide the client with clear options that deal with the client's behavior, set limits on behavior, and make the client aware of the consequences of anger and violence.
7. Discuss the use of **restraints (security devices)** or **seclusion** if the client is unable to control angry behavior that may lead to violence.
8. Assist the client with problem-solving and decision-making regarding the options.

F. Restraints (security devices) and seclusion
1. Description
   - **a.** Physical restraints: Any physical or environmental means of controlling an individual's behavior or actions that inhibits free movement
   - **b.** Seclusion: A type of restraint in which a client is confined in a room specially designed for protection and close supervision from which the client cannot freely exit.
   - **c.** Chemical restraints: Medications given for the specific purpose of inhibiting a specific behavior or movement and that have an impact on the client's ability to relate to the environment
2. Use of restraints and seclusion
   - **a.** Restraints and seclusion should never be used as punishment or for the convenience of the health care staff.
   - **b.** Restraints and seclusion are used when behavior is physically harmful to the client or others and when alternative or less restrictive measures are insufficient in protecting the client or others from harm.
   - **c.** Restraints and seclusion are used when the health care team anticipates that a controlled environment would be helpful and requests restraints or seclusion.
   - **d.** The nurse must document the behavior leading to the use of restraints or seclusion.
   - **e.** In most settings, a primary health care provider's (PHCP) prescription is required prior to the use of restraints.
   - **f.** In an emergency, a qualified nurse may place a client in restraints or seclusion and obtain a written or verbal prescription as soon as possible thereafter.
   - **g.** Per state guidelines, within 1 hour of the initiation of restraints or seclusion, the psychiatrist must make a face-to-face assessment and evaluation of the client and must continuously reevaluate the need for continued restraints or seclusion.
   - **h.** While in restraints or seclusion, the client must be protected from all sources of harm.
   - **i.** The client in restraints or seclusion needs constant one-to-one supervision; physical, safety, and comfort needs must be assessed every 15 to 30 minutes, and these observations are also documented (e.g., food, fluids, bathroom needs, range-of-motion exercise, and ambulation).
   - **j.** The nurse must always follow agency procedures and policies regarding the use of restraints and must also be familiar with their use for the older client and juveniles.

! Restraints require a written prescription by a PHCP, which must be reviewed and renewed per agency policy; the prescription must specify the type of restraint to be used, the duration of the restraint or seclusion, and the criteria for release (agency policy and procedures need to be followed).

VIII. Bullying

A. Bullying is the **abuse** of power by an individual toward another through repeated aggressive acts.

B. It most often occurs in children and in high school or college environments but can also occur in the workplace or other environments.

C. The bully feels power from sources such as physical strength, maturity, or a higher status within a peer group; from knowing the victim's weaknesses; or from support of others.

D. Bullying can occur in the form of physical harm, relational aggression, isolation and exclusion, and verbal harm such as slander, rumors, or threats; it is both intentionally cruel and unprovoked.

E. Cyberbullying is also a form of bullying and occurs in the form of Internet messages on social media networks, text messages, emails, photos being posted, and rumors.

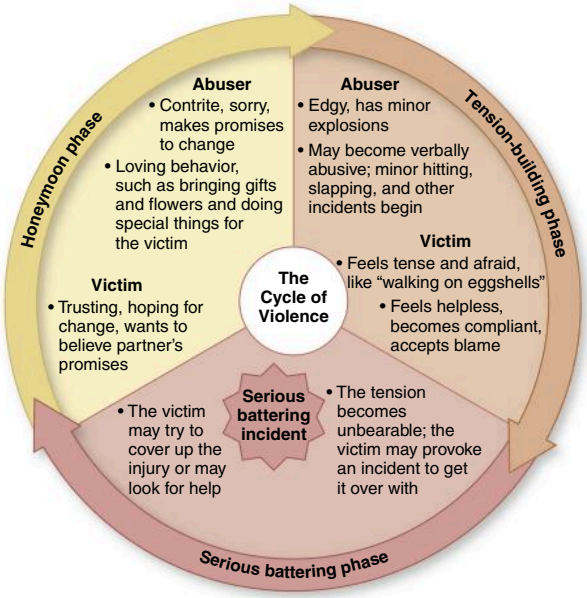
F. The bullied person repeatedly experiences negative actions from the bully or bullies.

G. These bullying acts can lead to depression, low self-esteem, humiliation, isolation, and social withdrawal in the victim; they could result in self-harm such as cutting, suicide, or murder.

H. The nurse's responsibility is to observe for signs of bullying and to educate teachers, school administrators, and parents about bullying behaviors and signs that bullying may be occurring.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu



Honeymoon phase
Abuser
• Contrite, sorry, makes promises to change
• Loving behavior, such as bringing gifts and flowers and doing special things for the victim
Victim
• Trusting, hoping for change, wants to believe partner's promises
Tension-building phase
Abuser
• Edgy, has minor explosions
• May become verbally abusive; minor hitting, slapping, and other incidents begin
Victim
• Feels tense and afraid, like "walking on eggshells"
• Feels helpless, becomes compliant, accepts blame
The Cycle of Violence
Serious battering incident
• The victim may try to cover up the injury or may look for help
• The tension becomes unbearable; the victim may provoke an incident to get it over with
Serious battering phase

FIG. 68.1 The cycle of violence.

IX. Family Violence

A. Description (Fig. 68.1)
1. Violence begins with threats or verbal or physical minor assaults (tension building), and the victim attempts to comply with the requests of the abuser.
2. In the next step of the cycle abusers lose control and become destructive and harmful (acute battering), whereas victims attempt to protect themselves.
3. After the battering, the abuser becomes loving and attempts to make peace (calmness and diffusion of tension); undoing behavior is characteristic, in which the abuser gives gifts and positive attention to the victim to undo the negative behavior.
4. The abuser justifies that violence is normal and the victim is responsible for the abuse.
5. Outsiders are usually unaware of what is happening in the family.
6. Family members are isolated socially and lack autonomy and trust among one another; caring and intimacy in the family are absent.
7. Family members expect other members of the family to meet their needs, but none is able to do so.
8. The abuser threatens to abandon the family.

B. Types of violence (Box 68.7)

C. The vulnerable person (victim)
1. The vulnerable person is the one in the family unit against whom violence is perpetrated.
2. The most vulnerable individuals are children and older adults.
3. Battering is a crime.

BOX 68.7 Types of Violence

Physical Violence: Infliction of physical pain or bodily harm
Sexual Violence: Any form of sexual contact without consent
Emotional Violence: Infliction of mental anguish
Physical Neglect: Failure to provide health care to prevent or treat physical or emotional illnesses
Developmental Neglect: Failure to provide physical and cognitive stimulation needed to prevent developmental deficits
Educational Neglect: Depriving a child of education
Economic Exploitation: Illegal or improper exploitation of money, funds, or other resources for one's personal gain

D. Characteristics of abusers
1. Impaired self-esteem
2. Strong dependency needs
3. Narcissistic and suspicious
4. History of abuse during childhood
5. Perceive victims as their property and believe that they are entitled to abuse them

E. Characteristics of victims
1. Some may have a dependent personality disorder.
2. Feel trapped, dependent, helpless, and powerless
3. May become depressed as they are trapped in the abusers' power and control cycle (see Fig. 68.1)
4. As victims' self-esteem becomes diminished with chronic abuse, they may blame themselves for the violence and be unable to see a way out of the situation.

F. Interventions
1. Report suspected or actual cases of child abuse or abuse of an older adult to appropriate authorities (follow state and agency guidelines).
2. Referral to appropriate sexual assault/domestic violence (SADV) team or other appropriate agency team
3. Assess for evidence of physical injuries.
4. Ensure privacy and confidentiality during the assessment, and provide a nonjudgmental and empathetic approach to foster trust; reassure victims that they have done nothing wrong. Box 68.8 lists sample assessment questions.
5. Assist the victim to develop self-protective and other problem-solving abilities.
6. Even if the victim is not ready to leave the situation, encourage the victim to develop a specific safety plan (a fast escape if the violence returns), and provide information on where to obtain help (hotlines, safe houses, and shelters); an abused person is usually reluctant to call the police.
7. Assess suicidal potential of the victim.
8. Assess the potential for homicide.
9. Assess for the use of drugs and alcohol.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 68.8 Assessment Questions for Violence and Abuse

- "Has anyone ever touched you in a way that made you uncomfortable?"
- "Are these injuries a result of someone harming you?"
- "Is anyone hurting you now?"
- "How do you and your partner deal with anger (or disagreement)?"
- "Has your partner ever hit you?"
- "Have you ever been threatened by _____?"
- "Does your partner prevent you from seeing family or friends?"
- "Does your partner ever use the children to manipulate you?"
- "Did (or does) anyone in your family deal with anger by hitting?"

10. Determine family coping patterns and support systems.
11. Provide support and assistance in coping with contacting the legal system.
12. Assist in resolving family dysfunction with prescribed therapies.
13. Encourage individual therapy for the victim that promotes coping with the trauma and prevents further psychological conflict.
14. Encourage individual therapy for the abuser that focuses on preventing violent behavior and repairing relationships.
15. Encourage psychotherapy, counseling, group therapy, and support groups to assist family members to develop coping strategies.
16. Assist the family to identify an access to community and personal resources.
17. Maintain accurate and thorough medical health records.

X. Child Abduction

A. Description

1. Child abduction is the kidnapping of a child (or infant) by an older person.
2. Occurrences
   - **a.** A stranger may kidnap a child for criminal or mischievous purposes.
   - **b.** A stranger may kidnap a child (or infant) to bring up the child as that person's own child.
   - **c.** A parent removes or retains a child from the other parent's care (often in the course of or after divorce proceedings).
3. Because of the increased independence that occurs in the preschool-age child, parents are less able once their children reach this age to provide the constant protection they once did; interventions that ensure protection (including teaching the child) are necessary.
4. Questions that help reveal the potential for abuse include: "Who do you play with most often? Is there anyone you do not like to play with? Are there games you don't like to play?"

B. Interventions

1. Instruct the parents to teach a child basic guidelines about personal safety that include the following:
   - **a.** Do not go anywhere alone.
   - **b.** Always tell an adult where you are going and when you will return.
   - **c.** Say *no* if you feel uncomfortable with a situation.
   - **d.** If any adult offers you anything without asking your parent first, step away, say no, and tell someone.
   - **e.** If any adult asks for your help without asking your parent first, step away, say no, and tell someone.
   - **f.** If any adult asks you to keep a secret, step away, say no, and tell someone.
   - **g.** Do not help anyone look for a lost dog or cat and do not accept candy or gifts from a stranger.
   - **h.** If lost in a store, do not wander around looking for the parent; go at once to a clerk or guard.
2. Children need to learn their full name, address, and parents' names and phone numbers.
3. Watch for post-traumatic stress disorder in any child who has experienced an abduction.

XI. Child Abuse

A. Description

1. Abuse is the nonaccidental physical injury or the nonaccidental act of omission of care by a parent or person responsible for a child; abuse comprises neglect and physical, sexual, and emotional maltreatment.
2. Neglect can be in the form of physical or emotional neglect and involves the deprivation of basic needs, supervision, medical care, or education and failure to meet a child's needs for attention and affection.
3. Sexual abuse can involve incest, molestation, exhibitionism, pornography, prostitution, or pedophilia; findings associated with sexual abuse may not be easily apparent in a child.
4. Shaken baby syndrome is caused by the violent shaking of an infant and results in intracranial (usually subdural hemorrhage) trauma; this can lead to cerebral edema and death.

B. Assessment (Box 68.9)

C. Interventions

1. Support the child during a thorough physical assessment.
2. Assess injuries.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 68.9 Child Neglect and Abuse: Assessment Findings

Neglect
- Inadequate weight gain
- Poor hygiene
- Consistent hunger
- Inconsistent school attendance
- Constant fatigue
- Reports of lack of child supervision
- Delinquency

Physical Abuse
- Unexplained bruises, burns, or fractures
- Bald spots on the scalp
- Apprehensive child
- Extreme aggressiveness or withdrawal
- Fear of parents
- Lack of crying (older infant, toddler, or young preschool child) when approached by a stranger
- Spiral fractures without history of trauma from a sports injury
- Poor performance in school

Emotional Abuse
- Speech disorders
- Habit disorders such as sucking, biting, and rocking
- Psychoneurotic reactions
- Learning disorders
- Suicide attempts

Sexual Abuse
- Difficulty walking or sitting
- Torn, stained, or bloody underclothing
- Pain, swelling, or itching of genitals
- Deformities, bruises, bleeding, or lacerations in genital or anal area
- Unwillingness to change clothes or unwillingness to participate in gym activities
- Poor peer relations
- Poor performance in school

Shaken Baby Syndrome
- External signs of trauma are usually absent
- Ophthalmoscopic examination reveals retinal hemorrhages
- Full bulging fontanels and head circumference greater than expected

3. If shaken baby syndrome is suspected, monitor the infant for a decrease in level of consciousness, which can indicate increased intracranial pressure (ICP).
4. Report a case of suspected abuse; nurses are legally required to report all cases of suspected child abuse to the appropriate local or state agency.
5. Place the child in an environment that is safe, preventing further injury.
6. Document information related to the suspected abuse in an objective manner.
7. Assess parents' strengths and weaknesses, normal coping mechanisms, and presence or absence of support systems.
8. Assist the family in identifying stressors, support systems, and resources.
9. Refer the family to appropriate support groups.

Nurses are legally required to report all cases of suspected child abuse or elder abuse to the appropriate local or state agency; state laws and procedures may vary and are always followed.

XII. Latchkey Children

A. Description
1. Children who do not have adult supervision before or after school hours; they are left to care for themselves during these times.
2. Occurs when children are members of a single-parent family or when both parents work and need to leave the home before children are brought to school or arrive home after the children
3. This situation induces a stress-provoking environment for the children and places the children at risk for an unsafe situation, injury, and delinquent behavior.

B. Interventions
1. Identify the latchkey child.
2. Encourage the parent to teach the child about self-care and self-help skills.
3. Assist the parent to identify possible alternatives to leaving the child alone.
4. Inform the parent about available community resources, such as after-school programs for children.

XIII. Abuse of the Older Adult

A. Description
1. Abuse of an older adult involves physical, emotional, or sexual abuse; neglect; and economic exploitation.
2. Older adults at most risk include individuals who are dependent because of illness, immobility, or altered mental status.
3. Factors that contribute to abuse and neglect include long-standing family violence, caregiver stress, and the older adult's increasing dependence on others.
4. Victims may attempt to dismiss injuries as accidental, and abusers may prevent victims from receiving proper medical care to avoid discovery.
5. Victims often are isolated socially by their abusers.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

B. Assessment
1. Physical abuse
   - **a.** Sprains, dislocations, or fractures
   - **b.** Abrasions, bruises, or lacerations
   - **c.** Pressure sores
   - **d.** Puncture wounds
   - **e.** Burns
   - **f.** Skin tears
2. Sexual abuse
   - **a.** Torn or stained underclothing
   - **b.** Discomfort or bleeding in the genital area
   - **c.** Difficulty in walking or sitting
   - **d.** Unexplained genital infections or disease
3. Emotional abuse
   - **a.** Confusion
   - **b.** Fearfulness and agitation
   - **c.** Changes in appetite and weight
   - **d.** Withdrawal and loss of interest in self and social activities
4. Neglect
   - **a.** Disheveled appearance
   - **b.** Inadequate or inappropriate dress
   - **c.** Dehydration and malnutrition
   - **d.** Lack of physical needs, such as glasses, hearing aids, and dentures
5. Signs of medication overdose
6. Economic exploitation
   - **a.** Inability to pay bills and fearful when discussing finances
   - **b.** Confusion, inaccuracy, or no knowledge of finances

C. Interventions
1. Assess for physical injuries, and treat physical injuries.
2. Ask if any injury is a result of someone harming them.
3. Report cases of suspected abuse to appropriate authorities (follow state and agency guidelines).
4. Separate the older adult from the abusive environment, if possible, and contact adult protective services for assistance in placement while the abuse is being investigated.
5. Explore alternative living arrangements that are least restrictive and disruptive to the victim.
6. The older adult who has been abused may need assistance for financial or legal matters.
7. Provide referrals to emergency community resources.
8. When working with caregivers, assess the need for respite care or counseling to deal with caregiver stress (see Clinical Judgment: Take Action box).

CLINICAL JUDGMENT: TAKE ACTION

The nurse working in the emergency department suspects physical abuse of an 84-year-old client by the client's significant other. To ensure client safety, the nurse takes the following actions:

- Assesses and treats the wounds.
- Ensures that the victim is removed from the threatening environment.
- Adheres to mandatory abuse reporting laws.
- Notifies the caseworker of the situation.
- Documents the occurrence, findings, actions taken, and the victim's response.

XIV. Rape and Sexual Assault

A. Description
1. Rape is engaging another person in a sexual act or sexual intercourse through the use of force or coercion and without the consent of the sexual partner.
2. The victim is not required by law to report the rape or assault.
3. Often, the victim is blamed by others and receives no support from significant others.
4. Acquaintance rape involves someone known to the victim.
5. Statutory rape is the act of sexual intercourse with a person younger than the age of legal consent, even if the minor consents.
6. Same-gender rape
   - **a.** Involves sexual touching, oral sex, or penetration with a finger or some other object
   - **b.** Often experience stigma when seeking help
   - **c.** See https://www.cdc.gov/violenceprevention/sexualviolence/index.html for more information.
7. Marital rape
   - **a.** The belief that marriage bestows rights to sex whenever wanted and without consent of the partner contributes to the occurrence of marital rape.
   - **b.** Victims of marital rape describe being forced to perform acts they did not wish to perform and being physically abused during sex.

B. Assessment
1. For applicable victims:
   - **a.** Obtain the date of the last menstrual period.
   - **b.** Determine the form of birth control used and the last act of intercourse before rape.
   - **c.** Determine the duration of intercourse, orifices violated, and whether penile penetration occurred.
   - **d.** Determine whether a condom was used by the perpetrator.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

C. Shame, embarrassment, and humiliation
D. Anger and revenge
E. Afraid to tell others because of fear of not being believed
F. Some individuals may have been sexually abused as children and as adults and are the usual targeted victim of pedophiles; some individuals may have more difficulty with disclosing their abuse.
G. Rape trauma syndrome
   1. Sleep disturbances, nightmares
   2. Loss of appetite
   3. Fears, anxiety, phobias, suspicion
   4. Decrease in activities and motivation
   5. Disruptions in relationships with partner, family, friends
   6. Self-blame, guilt, shame
   7. Lowered self-esteem, feelings of worthlessness
   8. Somatic complaints
   9. See Chapter 66 for information on posttraumatic stress disorder.
H. Interventions (see Clinical Judgment: Take Action box)

CLINICAL JUDGMENT: TAKE ACTION

A victim of rape has just arrived at the emergency department. The emergency department nurse takes the following actions:

- Performs the victim's assessment in a quiet, private area
- Makes a referral to the sexual assault/domestic violence (SADV) nurse as appropriate
- Stays with the victim and provides client safety
- Assesses the victim for physical injuries and treats as appropriate
- Assesses the victim's stress level before performing treatments and procedures
- Explains to the victim why showering, bathing, douching, or changing clothing cannot be done until an examination is performed
- Obtains written consent from the victim for the examination, photographs, laboratory tests, release of information, and laboratory samples
- Assists with the pelvic or other examination and obtains specimens to detect bodily fluids of another (the pelvic examination may trigger a flashback of the attack); offers a shower and fresh clothing to the victim after the examination
- Preserves any evidence
- Treats physical injuries and provides client safety
- Administers prescribed medications
- Documents all events in the care of the victim
- Reinforces to the victim that surviving the assault is most important; if the victim survived the rape, then the victim did exactly what was necessary to stay alive
- Refers the victim to crisis intervention and support groups

PRACTICE QUESTIONS

1. The nurse observes that a client with a potential for violence is agitated, pacing up and down the hallway, and making aggressive and belligerent gestures at other clients. Which statement would be **most appropriate** to make to this client?
   1. "You need to stop that behavior now."
   2. "You will need to be placed in seclusion."
   3. "You seem restless; tell me what is happening."
   4. "You will need to be restrained if you do not change your behavior."

2. The nurse is reviewing the assessment data of a client admitted to the mental health unit. The nurse notes that the admission nurse documented that the client is experiencing anxiety as a result of a situational crisis. The nurse plans care for the client, determining that this type of crisis could be caused by which event?
   1. Witnessing a murder
   2. The death of a loved one
   3. A fire that destroyed the client's home
   4. A recent rape episode experienced by the client

3. The nurse is conducting an initial assessment of a client in crisis. When assessing the client's perception of the precipitating event that led to the crisis, which is the **most appropriate** question?
   1. "With whom do you live?"
   2. "Who is available to help you?"
   3. "What leads you to seek help now?"
   4. "What do you usually do to feel better?"

4. The nurse is creating a plan of care for a client in a crisis state. When developing the plan, the nurse would consider which factor?
   1. A crisis state indicates that the client has a mental illness.
   2. A crisis state indicates that the client has an emotional illness.
   3. Presenting symptoms in a crisis situation are similar for all clients experiencing a crisis.
   4. A client's response to a crisis is individualized, and what constitutes a crisis for one client may not constitute a crisis for another client.

5. The nurse in the emergency department is caring for a young victim of sexual assault. The client's physical assessment is complete, and physical evidence has been collected. The nurse notes that the client is withdrawn, distracted, tremulous, and bewildered at times. How would the nurse interpret these behaviors?
   1. Signs of depression
   2. Reactions to a devastating event
   3. Evidence that the client is a high suicide risk
   4. Indicative of the need for hospital admission

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

6. A depressed client on an inpatient unit says to the nurse, "My family would be better off without me." Which is the nurse's **best** response?
   1. "Have you talked to your family about this?"
   2. "Everyone feels this way when they are depressed."
   3. "You will feel better once your medication begins to work."
   4. "You sound very upset. Are you thinking of hurting yourself?"

7. The nurse has been closely observing a client who has been displaying aggressive behaviors. The nurse observes that the behavior displayed by the client is escalating. Which nursing intervention is **most** helpful to this client at this time? **Select all that apply.**
   - ❑ 1. Initiate confinement measures.
   - ❑ 2. Acknowledge the client's behavior.
   - ❑ 3. Assist the client to an area that is quiet.
   - ❑ 4. Maintain a safe distance from the client.
   - ❑ 5. Allow the client to take control of the situation.

8. Which behavior observed by the nurse indicates a suspicion that a depressed adolescent client may be suicidal?
   1. The adolescent runs out of the therapy group, swearing at the group leader.
   2. The adolescent gives away a DVD and a cherished autographed picture of a performer.
   3. The adolescent becomes angry while speaking on the telephone and slams down the receiver.
   4. The adolescent gets angry with a roommate who borrowed the client's clothes without asking.

9. The police arrive at the emergency department with a client who has lacerated both wrists. Which is the **initial** nursing action?
   1. Administer an antianxiety agent.
   2. Assess and treat the wound sites.
   3. Secure and record a detailed history.
   4. Encourage and assist the client to ventilate feelings.

10. A moderately depressed client who was hospitalized 2 days ago suddenly begins smiling and reporting that the crisis is over. The client says to the nurse, "I'm finally cured." Based on the client's behavior and statement, which intervention would the nurse include in the plan?
    1. Suggesting a reduction of medication
    2. Allowing increased "in-room" activities
    3. Increasing the level of suicide precautions
    4. Allowing the client off-unit privileges as needed

11. The nurse is planning care for a client being admitted to the nursing unit who attempted suicide. Which **priority** nursing intervention would the nurse include in the plan of care?
    1. One-to-one suicide precautions
    2. Suicide precautions with 30-minute checks
    3. Checking the whereabouts of the client every 15 minutes
    4. Asking the client to report suicidal thoughts immediately

12. The emergency department nurse is caring for an adult client who is a victim of family violence. Which **priority** information would be included in the discharge instructions?
    1. Information regarding shelters
    2. Instructions regarding calling the police
    3. Instructions regarding self-defense classes
    4. Explanation of the importance of leaving the violent situation

13. A victim of a sexual assault is being seen in the crisis center. The client states, "I still feel as though the rape just happened yesterday," even though it has been a few months since the incident. Which is the **most appropriate** nursing response?
    1. "You need to try to be realistic. The rape did not just occur."
    2. "It will take some time to get over these feelings about your rape."
    3. "Tell me more about the incident that causes you to feel as if the rape just occurred."
    4. "What do you think that you can do to alleviate some of your fears about being raped again?"

14. A client is admitted to the mental health unit after an attempted suicide by hanging. The nurse can **best** ensure client safety by which action?
    1. Requesting that a peer remain with the client at all times.
    2. Removing the client's clothing and placing the client in a hospital gown.
    3. Assigning to the client a staff member who will remain with the client at all times.
    4. Admitting the client to a seclusion room where all potentially dangerous articles are removed.

15. A client is admitted with a recent history of severe anxiety following a home invasion and robbery. During the initial assessment interview, which statement by the client would indicate to the nurse the possible diagnosis of post-traumatic stress disorder? **Select all that apply.**
    - ❑ 1. "I'm afraid of spiders."
    - ❑ 2. "I keep reliving the robbery."
    - ❑ 3. "I see that face everywhere I go."
    - ❑ 4. "I don't want anything to eat now."
    - ❑ 5. "I might have died over a few dollars in my pocket."
    - ❑ 6. "I have to wash my hands over and over again many times."

Telegram & Insta: NCLEX_RN_Edu

ANSWERS

1. *Answer:* 3

Rationale: The most appropriate statement is to ask the client what is causing the agitation. This will assist the client to become aware of the behavior and may assist the nurse in planning appropriate interventions for the client. Option 1 is demanding behavior that could cause increased agitation in the client. Options 2 and 4 are threats to the client and are inappropriate.

Test-Taking Strategy: Note the **strategic words,** *most appropriate.* Eliminate option 1 because of the demand that it places on the client. Eliminate options 2 and 4 because they indicate threats to the client.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 334, 380-381.

2. *Answer:* 2

Rationale: A situational crisis arises from external rather than internal sources. External situations that could precipitate a crisis include loss or change of a job, the death of a loved one, abortion, change in financial status, divorce, addition of new family members, pregnancy, and severe illness. Options 1, 3, and 4 identify adventitious crises. An adventitious crisis refers to a crisis or disaster, is not a part of everyday life, and is unplanned and accidental. Adventitious crises may result from a natural disaster (e.g., floods, fires, tornadoes, earthquakes), a national disaster (e.g., war, riots, airplane crashes), or a crime of violence (e.g., rape, assault, murder in the workplace or school, bombings, or spousal or child abuse).

Test-Taking Strategy: Note the **subject,** situational crisis. Recall that this type of crisis arises from an external source and is associated with a life event that upsets an individual's or group's psychological equilibrium. This will direct you to the correct option.

References: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 333; Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. pp. 40-41.

3. *Answer:* 3

Rationale: The nurse's initial task when assessing a client in crisis is to assess the individual or family and the problem. The more clearly the problem can be defined, the better the chance a solution can be found. The correct option would assist in determining data related to the precipitating event that led to the crisis. Options 1 and 2 assess situational supports. Option 4 assesses personal coping skills.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Also note the **subject,** assessment techniques for the client in crisis, and note the words *precipitating event* and *led to the crisis*. Eliminate options 1 and 2, because these data would determine support systems. Eliminate option 4, because this question would be asked when determining coping skills.

Reference: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. p. 40-41.

4. *Answer:* 4

Rationale: Although each crisis response can be described in similar terms as far as presenting symptoms are concerned, what constitutes a crisis for one client may not constitute a crisis for another client, because each is a unique individual. Being in the crisis state does not mean that the client has a mental or emotional illness.

Test-Taking Strategy: Eliminate option 3 because of the **closed-ended word** "all." Next, eliminate options 1 and 2, because a crisis does not indicate "illness."

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 335.

5. *Answer:* 2

Rationale: During the acute phase of the rape crisis, the client can display a wide range of emotional and somatic responses. The symptoms noted indicate an expected reaction. Options 1, 3, and 4 are incorrect interpretations.

Test-Taking Strategy: Note the **subject,** client response to a crisis. Use knowledge regarding client responses to devastating events and focus on the symptoms noted in the question to direct you to the correct option.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 360.

6. *Answer:* 4

Rationale: Clients who are depressed may be at risk for suicide. It is critical for the nurse to assess suicidal ideation and plan. The nurse would ask the client directly whether a plan for self-harm exists. Options 1, 2, and 3 do not deal directly with the client's feelings.

Test-Taking Strategy: Note the **strategic word**, *best.* Recalling **therapeutic communication techniques** will assist in directing you to the correct option. Option 4 is the only option that deals directly with the client's feelings. In addition, clients at risk for suicide need to be assessed directly regarding the potential for self-harm.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93-94, 205.

7. *Answer:* 2, 3, 4

Rationale: During the escalation period, the client's behavior is moving toward loss of control. Nursing actions include taking control, maintaining a safe distance, acknowledging behavior, moving the client to a quiet area, and medicating the client if appropriate. To initiate confinement measures during this period is inappropriate. Initiation of confinement measures, if needed, is most appropriate during the crisis period.

Test-Taking Strategy: Focus on the **strategic word,** *most*, and focus on the subject, the most helpful nursing interventions. Also note the words *aggressive behaviors* and *escalating*. Recalling that, during the escalation period, the client's behavior is moving toward loss of control and that the least restrictive measures would be used will direct you to the correct options.

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 381-382.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

8. *Answer:* 2
Rationale: A depressed suicidal client often gives away that which is of value as a way of saying goodbye and wanting to be remembered. Options 1, 3, and 4 deal with anger and acting-out behaviors that are often typical of an adolescent.
Test-Taking Strategy: Eliminate options 1, 3, and 4 because they are **comparable or alike.** The correct option is different and is an action that could indicate that the client may be "saying goodbye."
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 368-369.

9. *Answer:* 2
Rationale: The initial nursing action is to assess and treat the self-inflicted injuries. Injuries from lacerated wrists can lead to a life-threatening situation. Other interventions, such as options 1, 3, and 4, may follow after the client has been treated medically.
Test-Taking Strategy: Note the **strategic word,** *initial*. Use **Maslow's Hierarchy of Needs theory** to prioritize. Physiological needs come first. The correct option addresses the physiological need.
References: Sweet, V., & Foley, P. (Editors). (2020). *Sheehy's emergency nursing: Principles and practice.* (7th ed.). St. Louis: Elsevier. p. 590; Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 32-33.

10. *Answer:* 3
Rationale: A client who is moderately depressed and has been in the hospital only 2 days is unlikely to have such a dramatic cure. When clients suddenly exhibit a lift in depression, it is likely that they may have made the decision to harm themselves. Suicide precautions are necessary to keep such clients safe. The remaining options are therefore incorrect interpretations.
Test-Taking Strategy: Focus on the **subject,** suicide precautions. Options 1 and 4 support the client's notion that a cure has occurred. Option 2 allows the client to increase self-isolation and would present a threat to the client's safety. Knowing that safety is of the utmost importance will direct you to the correct option.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 209.

11. *Answer:* 1
Rationale: One-to-one suicide precautions are required for a client who has attempted suicide. Options 2 and 3 may be appropriate, but not at the present time, considering the situation. Option 4 also may be an appropriate nursing intervention, but the priority is identified in the correct option. The best intervention for clients who may attempt to harm themselves is constant supervision so that the nurse may intervene as needed.
Test-Taking Strategy: Focus on the **strategic word**, *priority*, noting the words *attempted suicide*. The correct option is the only one that provides a safe environment.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 372.

12. *Answer:* 1
Rationale: Tertiary prevention of family violence includes assisting the victim after the abuse has already occurred. The nurse would provide the client with information regarding where to obtain help, including a specific plan for removing the self from the abuser and information regarding escape, hotlines, and the locations of shelters. An abused person is usually reluctant to call the police. Teaching the victim to fight back is not the appropriate action for the victim when dealing with a violent person. Explaining the importance of leaving the violent situation is important, but a specific plan is necessary.
Test-Taking Strategy: Note the **strategic word,** *priority*. Focus on the **subject** of the question, which relates to providing the client with a safe environment. The correct option provides a specific plan for safety.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 336-337, 349.

13. *Answer:* 3
Rationale: The correct option allows the client to express ideas and feelings more fully and portrays an unhurried, nonjudgmental, supportive attitude on the part of the nurse. Clients need to be reassured that their feelings are normal and that they may express their concerns freely in a safe, caring environment. Option 1 immediately blocks communication. Option 2 places the client's feelings on hold. Option 4 places the problem-solving totally on the client.
Test-Taking Strategy: Note the **strategic words,** *most appropriate*. Also, focus on the **subject,** that the client feels that the rape just happened yesterday. Use **therapeutic communication techniques.** The correct option is the only one that addresses the client's feelings. Always address the client's feelings first.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 93-94, 360.

14. *Answer:* 3
Rationale: Hanging is a serious suicide attempt. The plan of care must reflect action that ensures the client's safety. Constant observation status (one-to-one) with a staff member is the best choice. Placing the client in a hospital gown or requesting that a peer remain with the client would not ensure a safe environment. Seclusion would not be the initial intervention, and the least restrictive measure would be used.
Test-Taking Strategy: Note the **strategic word,** *best*. Focus on the **subject,** care of the client at risk for suicide. Eliminate option 4, because seclusion should not be the initial intervention. Eliminate option 1 next, because safeguarding a client is not the peer's responsibility. Eliminate option 2, because removing the client's clothing would not maximize all possible safety strategies.

Telegram & Insta: NCLEX_RN_Edu

Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 370, 372.

15. ***Answer:*** **2, 3, 5**

Rationale: Reliving an event, experiencing emotional numbness (facing possible death), and having flashbacks of the event (seeing the same face everywhere) are all common occurrences with post-traumatic stress disorder. The statement "I'm afraid of spiders" relates more to having a phobia. The statement "I have to wash my hands over and over again many times" describes ritual compulsive behaviors to decrease anxiety for someone with obsessive-compulsive disorder. Stating "I don't want anything to eat now" is vague and could relate to numerous conditions.

Test-Taking Strategy: Focus on the **subject,** post-traumatic stress disorder. There is no indication about a fear of spiders being part of the problem. There is no information in the question to support that the client has ritual behaviors. The statement of "I don't want anything to eat now" is not relevant to this client's situation. Responses 2, 3, and 5 all indicate that the client is experiencing post-traumatic stress disorder from a recent home invasion and robbery event.

Reference: Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings.* (5th ed.). St. Louis: Elsevier. pp. 163, 167-169.

PRIORITY CONCEPTS Anxiety; Mood and Affect

I. Selective Serotonin Reuptake Inhibitors (SSRIs) (Box 69.1)

A. Description
1. Inhibit serotonin uptake and elicit an antidepressant response
2. Effective for depression with anxiety features as well as depression with psychomotor agitation
3. Relatively low side-effect profile compared with older antidepressants (tricyclics)
4. Do not create anticholinergic effects, dry mouth, blurred vision, or urinary retention
5. May interact with other medications (e.g., digoxin, warfarin)
6. The potential for medication interactions is greatest when administered with second serotonin-enhancing agent, such as a monoamine oxidase inhibitor (MAOI). A complete medication assessment must be obtained and evaluated; inquire about the use of herbal therapies, especially St. John's wort.

B. Side and adverse effects
1. Dry mouth
2. Blood pressure changes
3. Insomnia, somnolence (sleepy, drowsy), apathy
4. Nervousness
5. Weight loss or gain
6. Decreased libido
7. Apathy
8. Tremors
9. Seizure activity
10. Potential toxic effects (too high dose or interaction with other drugs)
    - **a.** Abdominal pain, diarrhea
    - **b.** Sweating, fever
    - **c.** Tachycardia, elevated blood pressure
    - **d.** Altered mental state (delirium)
    - **e.** Myoclonus (muscle spasms), increased motor activity

C. Interventions
1. Monitor vital signs, because SSRIs can potentially lower or elevate blood pressure.
2. May cause sexual dysfunction or lack of sex drive. Inform health care provider if this occurs.
3. Initiate safety precautions and contact the PHCP if dizziness occurs.
4. Instruct the client to avoid alcohol.
5. Administer with a snack or meal to reduce the risk of dizziness and light-headedness.
6. Monitor the suicidal client, especially during improved mood and increased energy levels.
7. Instruct the client that taking ibuprofen with SSRIs increases the risk of an upper GI bleed.
8. For the client on long-term therapy, monitor liver and renal function test results; altered values may occur, requiring dosage adjustments.
9. Monitor white blood cell and neutrophil counts; the medication may be discontinued if levels decrease below normal.
10. Instruct to change positions slowly if experiencing a hypotensive effect.
11. Educate the client to not discontinue medication abruptly. Abrupt cessation can lead to serotonin withdrawal characterized by gastrointestinal distress, movement disorders, insomnia, and sensory disturbances.
12. Be aware of the potential for serotonin syndrome, characterized by hyperactivity or restlessness, tachycardia, fever, elevated blood pressure, altered mental status (delirium), mood swings, seizures, muscle rigidity, and abdominal pain; this risk is greatly increased when SSRIs are given with MAOIs. This medication combination needs to be avoided.
13. Instruct that over-the-counter (OTC) cold medicines may increase the likelihood of serotonin syndrome.

Telegram & Insta: NCLEX_RN_Edu

BOX 69.1 Reuptake Inhibitors

Selective Serotonin Reuptake Inhibitors
- Citalopram
- Escitalopram
- Fluoxetine
- Fluvoxamine
- Paroxetine
- Sertraline
- Vilazodone

Serotonin-Norepinephrine Reuptake Inhibitors
- Desvenlafaxine
- Duloxetine
- Levomilnacipran
- Venlafaxine

Atypical Antidepressants
- Brexanolone
- Bupropion
- Mirtazapine
- Nefazodone
- Trazodone
- Vortioxetine

BOX 69.2 Tricyclic Antidepressants
- Amitriptyline
- Amoxapine
- Clomipramine
- Desipramine
- Doxepin
- Imipramine
- Nortriptyline
- Protriptyline
- Trimipramine

CLINICAL JUDGMENT: TAKE ACTION

The nurse receives a report from the emergency medical service (EMS) technicians. The EMS technicians inform the emergency department nurse that the client is suspected of a tricyclic antidepressant overdose. Based on this information, the nurse takes the following actions:

- Checks airway and maintains a patent airway.
- Administers oxygen and ventilation (as required).
- Checks vital signs and initiates cardiac monitoring.
- Obtains an electrocardiogram.
- Prepares for gastric lavage with activated charcoal if within 2 hours of ingestion.
- Administers intravenous fluids as prescribed.
- Prepares to administer medications as prescribed to reverse the effects of the tricyclic antidepressant.
- Documents the event, actions taken, and the client's response.

14. In pregnancy, consultation with an obstetrician is recommended regarding taking these medications.
15. Monitor the medication response in children, adolescents, and older adults closely, because the response may be different than in an adult client.
16. Encourage psychotherapy.
17. Serotonin-norepinephrine reuptake inhibitors (SNRI) are similar to SSRIs, but they also work by blocking the effects of norepinephrine in addition to serotonin. Considerations are similar to that of SSRIs.

II. Tricyclic Antidepressants (TCAs) (Box 69.2)

A. Description
1. Block the reuptake of norepinephrine and serotonin at the presynaptic junction; used to treat depression
2. Also affect other neurotransmitters, leading to a number of side effects
3. May reduce seizure threshold
4. May reduce effectiveness of antihypertensive agents
5. Concurrent use with alcohol or antihistamines can cause CNS depression.
6. Concurrent use with MAOIs can cause hypertensive crisis.
7. Cardiac toxicity can occur, and all clients should receive an electrocardiogram (ECG) before treatment and periodically thereafter.
8. Overdose is life-threatening, necessitating immediate treatment (see Clinical Judgment: Take Action box).
9. The tricyclic antidepressant clomipramine may be used to treat obsessive-compulsive disorder.

B. Side and adverse effects
1. Anticholinergic effects: Dry mouth, difficulty voiding, dilated pupils and blurred vision, decreased gastrointestinal motility, constipation
2. Urinary retention
3. Cardiovascular disturbances such as tachycardia or dysrhythmias; orthostatic hypotension
4. Sedation
5. Seizures (with bupropion)
6. Weight gain or weight loss
7. Anxiety, restlessness, irritability, confusion
8. Decreased or increased libido with ejaculatory and erection disturbances
9. Symptoms of TCA toxicity
   - **a.** Tardive dyskinesia: involuntary movement of the face and jaw
   - **b.** Akinesia: loss of voluntary muscle movement
   - **c.** Akathisia: state of agitation, distress, and restlessness
   - **d.** Pseudoparkinsonism

C. Interventions
1. Monitor the suicidal client, especially during improved mood and increased energy levels.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Instruct the client to change positions slowly to avoid a hypotensive effect.
3. Monitor pattern of daily bowel activity.
4. Assess for urinary retention.
5. For the client on long-term therapy, monitor liver and renal function test results.
6. Administer with food or milk if gastrointestinal distress occurs.
7. Administer the entire daily oral dose preferably at bedtime because of the sedative effect. Do not split doses, such as taking half in the morning and half in the evening.
8. Instruct the client to avoid alcohol and nonprescription medications to prevent adverse medication interactions.
9. Instruct the client to avoid driving and other activities requiring alertness until the response is known; sedation is expected in early therapy and may subside with time.
10. When the medication is discontinued by the primary health care provider (PHCP), it should be tapered gradually.
11. The potential for medication interactions with OTC cold medications exists.
12. Encourage oral hygiene and the use of hard candies and mouth rinses to relieve dry mouth.
13. Encourage psychotherapy.

⚠ Inform the client that antidepressant medication may take several weeks to produce the desired effect (client response may not occur until 2 to 4 weeks after the first dose).

III. Monoamine Oxidase Inhibitors (MAOIs) (Box 69.3)

A. Description
1. Inhibit the enzyme monoamine oxidase, which is present in the brain, blood platelets, liver, spleen, and kidneys
2. Monoamine oxidase metabolizes amines (dopamine, tyramine), norepinephrine, and serotonin, so the concentration of these amines increases with MAOIs.
3. Clients who have depression and have not responded to other antidepressant therapies, including electroconvulsive therapy, may be given MAOIs. These medications are not the first choice because of other available medications and the possible serious side and adverse effects that can occur.
4. Concurrent use with amphetamines, antidepressants, dopamine, epinephrine, levodopa/carbidopa, nasal decongestants, norepinephrine, tyramine-containing foods, or vasoconstrictors may cause hypertensive crisis.
5. Concurrent use with opioid analgesics may cause hypertension or hypotension, coma, or seizures.

BOX 69.3 Monoamine Oxidase Inhibitors (MAOIs)

- Isocarboxazid
- Phenelzine
- Selegiline
- Tranylcypromine

B. Side and adverse effects
1. Orthostatic hypotension
2. Changes in cardiac rate and rhythm
3. Restlessness
4. Insomnia
5. Dizziness and vertigo
6. Weakness, lethargy
7. Gastrointestinal upset or constipation
8. Urinary hesitancy
9. Dry mouth
10. Weight gain
11. Peripheral edema
12. Anticholinergic effects
13. CNS stimulation (anxiety, agitation, mania)
14. Sexual dysfunction

C. Hypertensive crisis
1. Hypertension
2. Occipital headache radiating frontally
3. Neck stiffness and soreness
4. Nausea and vomiting
5. Sweating
6. Fever and chills
7. Clammy skin
8. Dilated pupils
9. Palpitations, tachycardia, or bradycardia
10. Constricting chest pain
11. Antidote for hypertensive crisis: Phentolamine by intravenous injection

D. Interventions
1. Monitor blood pressure frequently for hypertension.
2. Monitor for signs of hypertensive crisis.
3. If palpitations or frequent headaches occur, withhold the medication and notify the PHCP.
4. Administer with food if gastrointestinal distress occurs.
5. Instruct the client that the medication effect may be noted during the first week of therapy, but maximum benefit may take 3 weeks.
6. Instruct the client to report headache, neck stiffness, or neck soreness immediately.
7. Instruct the client to change positions slowly to prevent orthostatic hypotension.
8. Instruct the client to avoid caffeine or stimulant OTC preparations, such as weight-reducing pills or medications for hay fever and colds.
9. Monitor compliance with medication administration.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

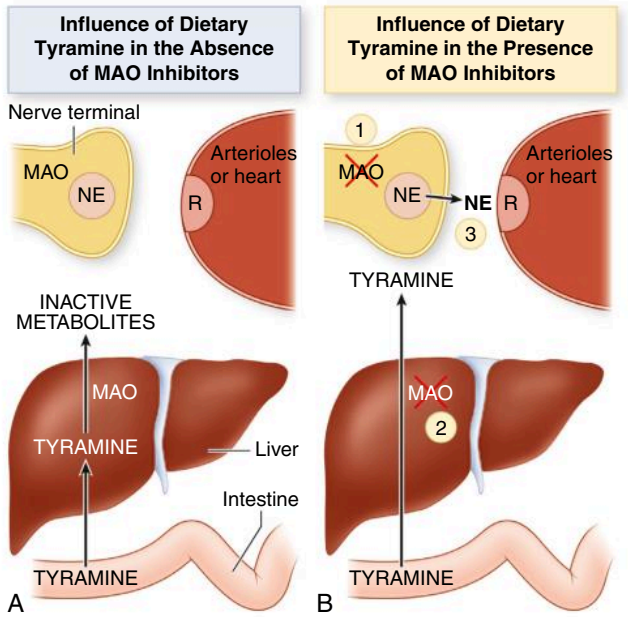

FIG. 69.1 Interaction between dietary tyramine and monoamine oxidase inhibitors (MAOIs). **A,** In the absence of MAOIs, much of the ingested tyramine is inactivated by MAO in the intestinal wall (not shown in the figure). Any dietary tyramine that is not metabolized in the intestinal wall is transported directly to the liver, where it undergoes immediate inactivation by hepatic MAO. No tyramine reaches the general circulation. **B,** Three events occur in the presence of MAOIs: (1) inhibition of neuronal MAO increases levels of norepinephrine (NE) in sympathetic nerve terminals; (2) inhibition of intestinal and hepatic MAO allows dietary tyramine to pass through the intestinal wall and liver and enter the systemic circulation intact; (3) on reaching peripheral sympathetic nerve terminals, tyramine promotes the release of accumulated NE stores, causing massive vasoconstriction and excessive stimulation of the heart. *R,* Receptor for NE.

10. Instruct the client that they may take a missed dose within 3 hours of the scheduled time; otherwise, the client should skip the missed dose and take the next dose at the scheduled time.
11. Instruct the client to carry a MedicAlert card indicating that an MAOI medication is being taken.
12. Avoid administering the medication in the evening, because insomnia may result.
13. When the medication is discontinued by the PHCP, it should be discontinued gradually.
14. Instruct the client to avoid foods that require bacteria or molds for their preparation or preservation and foods that contain tyramine (Fig. 69.1; Box 69.4).

Teach the client about foods that contain tyramine. Consuming tyramine-containing foods when taking an MAOI can cause hypertensive crisis.

IV. Mood Stabilizers (Box 69.5)

A. Description: Affect cellular transport mechanism and enhance serotonin or γ-aminobutyric acid (GABA) function, or both, which are associated with mood

B. Lithium

1. Concurrent use with diuretics, fluoxetine, or nonsteroidal antiinflammatory drugs increases lithium reabsorption by the kidneys or inhibits lithium excretion, either of which increases the risk of lithium toxicity.
2. Acetazolamide, theophylline, phenothiazines, or sodium bicarbonate may increase renal excretion of lithium, reducing its effectiveness.
3. The therapeutic dose is only slightly less than the amount producing toxicity.
4. The therapeutic medication serum level of lithium is 0.6 to 1.2 mEq/L (0.6 to 1.2 mmol/L); the actual dose at which the therapeutic effect is achieved and the levels at which toxicity occurs are highly variable among individual clients.
5. The causes of an increase in the lithium level include decreased sodium intake; fluid and

BOX 69.4 Foods That Contain Tyramine

- Avocados
- Bananas
- Beef or chicken liver
- Brewer's yeast
- Broad beans
- Caffeine, such as in coffee, tea, or chocolate
- Cheese, especially aged, except cottage cheese
- Eggplant
- Figs
- Meat extracts and tenderizers
- Overripe fruit
- Papaya
- Pickled herring
- Raisins
- Red wine, beer, sherry
- Sauerkraut
- Sausage, bologna, pepperoni, salami
- Sour cream
- Soy sauce
- Yogurt

Note: These foods need to be avoided by the client taking an MAOI. Even a small amount of tyramine can increase the blood pressure and the force and/or rate of heart contractions.

BOX 69.5 Mood Stabilizers

Lithium Preparation

- Lithium carbonate

Other Mood Stabilizers

- Aripiprazole
- Brexpiprazole
- Carbamazepine
- Clozapine
- Gabapentin
- Lamotrigine
- Olanzapine
- Olanzapine/fluoxetine
- Oxcarbazepine
- Paliperidone
- Quetiapine
- Risperidone
- Valproate
- Ziprasidone

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

electrolyte loss associated with excessive sweating, dehydration, diarrhea, or diuretic therapy; and illness or overdose.

6. Serum lithium levels should be checked frequently after initiation of therapy and then every 1 to 2 months or whenever any behavioral change suggests an altered serum level.
7. Blood samples to check serum lithium levels should be drawn in the morning, 12 hours after the last dose was taken.
8. Lithium crosses the placental barrier freely and has been associated with fetal toxicity.

C. Side and adverse effects

1. Polyuria
2. Polydipsia
3. Edema
4. Dysrhythmia
5. Anorexia, nausea
6. Dry mouth, mild thirst
7. Abdominal bloating
8. Soft stools or diarrhea
9. Fine hand tremors
10. Inability to concentrate
11. Muscle weakness
12. Headache
13. Hypothyroidism and goiter

D. Interventions

1. Monitor the suicidal client, especially during improved mood and increased energy levels.
2. Administer the medication with food to minimize gastrointestinal irritation.
3. Instruct the client to avoid excessive amounts of coffee, tea, or cola, which have a diuretic effect.
4. Do not administer diuretics while the client is taking lithium.
5. Instruct the client to avoid alcohol.
6. Instruct the client to avoid OTC medications.
7. Instruct the client that they may take a missed dose within 2 hours of the scheduled time; otherwise, the client should skip the missed dose and take the next dose at the scheduled time.
8. Instruct the client not to adjust the dosage or stop the medication without consulting the PHCP, because lithium should be tapered and not discontinued abruptly.
9. Instruct the client about the signs and symptoms of lithium toxicity.
10. Instruct the client to notify the PHCP if polyuria, prolonged vomiting, diarrhea, or fever occurs.
11. Instruct the client that the therapeutic response to the medication is noted in 1 to 3 weeks.
12. Monitor the ECG, renal function tests, and thyroid tests (ensure that these tests are performed before the start of therapy).
13. Monitor weight.

Instruct the client taking lithium to maintain a fluid intake of 6 to 8 glasses of water a day and an adequate salt intake to prevent lithium toxicity.

E. Lithium toxicity

1. Description
   - **a.** Occurs when ingested lithium cannot be detoxified and excreted by the kidneys
   - **b.** Symptoms of toxicity begin to appear when the serum lithium level is at 1.5 mEq/L (1.5 mmol/L).
2. Mild toxicity
   - **a.** Serum lithium level of 1.5 mEq/L (1.5 mmol/L)
   - **b.** Apathy
   - **c.** Lethargy
   - **d.** Diminished concentration
   - **e.** Mild ataxia
   - **f.** Coarse hand tremors
   - **g.** Slight muscle weakness
3. Moderate toxicity
   - **a.** Serum lithium level of 1.5 to 2.0 mEq/L (1.5 to 2.0 mmol/L)
   - **b.** Nausea, vomiting
   - **c.** Severe diarrhea
   - **d.** Mild to moderate ataxia and incoordination
   - **e.** Slurred speech
   - **f.** Tinnitus
   - **g.** Blurred vision
   - **h.** Muscle twitching
   - **i.** Irregular tremor
4. Severe toxicity
   - **a.** Serum lithium level greater than 2.0 mEq/L (2.0 mmol/L)
   - **b.** Nystagmus
   - **c.** Muscle fasciculations
   - **d.** Deep tendon hyperreflexia
   - **e.** Visual or tactile hallucinations
   - **f.** Oliguria or anuria
   - **g.** Impaired level of consciousness
   - **h.** Tonic-clonic seizures or coma, leading to death
5. Interventions for lithium toxicity
   - **a.** Withhold lithium and notify the PHCP.
   - **b.** Monitor vital signs and level of consciousness.
   - **c.** Monitor cardiac status.
   - **d.** Prepare to obtain samples to monitor lithium, electrolytes, blood urea nitrogen, and creatinine levels and perform a complete blood cell count.
   - **e.** Monitor for suicidal tendencies and institute suicide precautions.

V. Antianxiety or Anxiolytic Medications

A. Description

1. Antianxiety medications depress the CNS, increasing the effects of GABA, which produces relaxation and may depress the limbic system.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 69.6 Benzodiazepines

- Alprazolam
- Chlordiazepoxide
- Clonazepam
- Clorazepate
- Diazepam
- Lorazepam
- Midazolam
- Oxazepam
- Temazepam
- Triazolam

Nonbenzodiazepine Anxiolytic

- Buspirone

2. Benzodiazepines have anxiety-reducing (anxiolytic), sedative-hypnotic, muscle-relaxing, and anticonvulsant actions (Box 69.6).
3. Benzodiazepines are contraindicated in clients with acute narrow-angle glaucoma and should be used cautiously in children and older adults.
4. Benzodiazepines interact with other CNS medications, producing an additive effect, and therefore should only be considered for short-term use.
5. Abrupt withdrawal of benzodiazepines can be potentially life-threatening, and withdrawal should occur only under medical supervision.

B. Side and adverse effects
1. Daytime sedation
2. Dizziness
3. Headaches
4. Blurred or double vision
5. Hypotension
6. Tremor
7. Amnesia
8. Slurred speech
9. Constipation or diarrhea
10. Lethargy
11. Behavioral change

C. Acute toxicity
1. Somnolence
2. Confusion
3. Diminished reflexes and coma
4. Flumazenil, a benzodiazepine antagonist administered intravenously, reverses benzodiazepine intoxication in 5 minutes.
5. A client being treated for an overdose of a benzodiazepine may experience agitation, restlessness, discomfort, and anxiety.

D. Interventions
1. Monitor for motor responses such as agitation, trembling, and tension.
2. Monitor for autonomic responses such as cold, clammy hands and sweating.
3. Monitor for paradoxical CNS excitement during early therapy, particularly in older adults and debilitated clients.
4. Monitor for visual disturbances, because the medications can worsen glaucoma.
5. Monitor liver and renal function test results and complete blood cell counts.
6. Reduce the medication dose as prescribed for the older adult client and for the client with impaired liver function.
7. Initiate safety precautions, because the older adult client is at risk for falling when taking the medication for sleep or anxiety.
8. Assist with ambulation if drowsiness or lightheadedness occurs.
9. Instruct the client that drowsiness usually disappears during continued therapy.
10. Instruct the client to avoid tasks that require alertness until the response to the medication is established.
11. Instruct the client to avoid alcohol.
12. Instruct the client not to take other medications without consulting the PHCP.
13. Instruct the client not to stop the medication abruptly (can result in seizure activity).

E. Withdrawal (see Clinical Judgment: Generate Solutions box)
1. To lessen withdrawal symptoms, the dosage of a benzodiazepine should be tapered gradually over 2 to 6 weeks.
2. Abrupt or too rapid withdrawal results in the following:
   a. Restlessness
   b. Irritability
   c. Insomnia
   d. Hand tremors
   e. Abdominal or muscle cramps
   f. Sweating
   g. Vomiting
   h. Seizures

CLINICAL JUDGMENT: GENERATE SOLUTIONS

A client has been taking alprazolam on a long-term basis for the treatment of anxiety. The psychiatric mental health nurse practitioner (PMHNP) has informed the nurse that the medication will be discontinued and that the client needs instructions about tapering off the medication. The nurse plans to include the following instructional points in the teaching plan:

- To taper the dose gradually over 2 to 6 weeks
- That abrupt or too rapid withdrawal can result in restlessness, irritability, insomnia, hand tremors, abdominal muscle cramps, sweating, vomiting, or seizures
- That if any manifestations occur during tapering, to notify the PMHNP immediately

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 69.7 Barbiturates and Sedative-Hypnotics

Barbiturates
- Pentobarbital
- Phenobarbital
- Secobarbital

Sedative-Hypnotics
- Chloral hydrate
- Eszopiclone
- Meprobamate
- Ramelteon
- Suvorexant
- Tasimelteon
- Zaleplon
- Zolpidem

BOX 69.8 Antipsychotic Medications

Typical Antipsychotics
- Chlorpromazine
- Fluphenazine decanoate
- Haloperidol
- Loxapine
- Perphenazine
- Thioridazine
- Thiothixene
- Trifluoperazine

Atypical Antipsychotics
- Aripiprazole
- Asenapine
- Brexpiprazole
- Cariprazine
- Clozapine
- Iloperidone
- Lurasidone
- Olanzapine
- Paliperidone
- Pimavanserin
- Quetiapine
- Risperidone
- Ziprasidone

VI. Barbiturates and Sedative-Hypnotics (Box 69.7)

A. Description
1. Depress the reticular activating system by promoting the inhibitory synaptic action of the neurotransmitter GABA
2. Used for short-term treatment of insomnia or for sedation to relieve anxiety, tension, and apprehension

B. Side and adverse effects
1. Dizziness and drowsiness
2. Confusion
3. Irritability
4. Allergic reactions
5. Agranulocytosis
6. Thrombocytopenic purpura
7. Megaloblastic anemia

C. Overdose
1. Tachycardia
2. Hypotension
3. Cold and clammy skin
4. Dilated pupils
5. Weak and rapid pulse
6. Signs of shock
7. Depressed respirations
8. Absent reflexes
9. Coma and death may result from respiratory and cardiovascular collapse.

D. Withdrawal
1. Severe withdrawal symptoms begin within 24 hours after the medication is discontinued in an individual with severe medication dependence.
2. Gradual withdrawal is used to detoxify a dependent client.
3. Anxiety
4. Behavioral changes
5. Insomnia
6. Nightmares
7. Daytime agitation
8. Tremors
9. Delirium
10. Seizures

E. Interventions
1. Administer lower doses as prescribed for the older client.
2. Medications should be used with caution in the client who has suicidal tendencies or has a history of drug addiction.
3. Maintain safety by supervising ambulation and using side rails at night as appropriate.
4. Instruct the client to take the medication as directed.
5. Instruct the client to avoid driving or operating hazardous equipment if drowsiness, dizziness, or unsteadiness occurs.
6. Instruct the client to avoid alcohol, because this allows more medication to enter the brain, causing feelings of depression and drowsiness, dizziness, slow and difficult breathing, confusion, and coma.
7. For clients with insomnia, instruct the client to take the medication 30 minutes before bedtime; avoid taking with a large amount of food to help absorption.
8. Instruct the client that a hangover effect may occur in the morning.
9. Instruct the client not to discontinue the medication abruptly.
10. Instruct clients taking chloral hydrate to take the medication with food and a full glass of water, fruit juice, or ginger ale to prevent gastric irritation.

VII. Antipsychotic Medications (Box 69.8)

A. Description
1. Improve the thought processes and behavior of the client with psychotic symptoms, especially clients with schizophrenia
2. Affect dopamine receptors in the brain, reducing psychotic symptoms
3. Typical antipsychotics are more effective for positive symptoms of schizophrenia, such as hallucinations, aggression, and delusions; these medications also block the chemoreceptor trigger zone and vomiting center in the brain, producing an antiemetic effect.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 69.9 Side and Adverse Effects of Antipsychotic Medications

Anticholinergic Effects
- Dry mouth
- Increased heart rate
- Urinary retention
- Constipation
- Hypotension

Extrapyramidal Effects
- Parkinsonism
- Tremors
- Masklike facies
- Rigidity
- Shuffling gait
- Dysphagia
- Drooling

Dystonias
- Abnormal or involuntary eye movements, including oculogyric crisis
- Facial grimacing
- Twisting of the torso or other muscle groups

Akathisia
- Restlessness
- Constant moving about

Tardive Dyskinesia
- Protrusion of the tongue
- Chewing motion
- Involuntary movements of the body and extremities

Other Side and Adverse Effects
- Drowsiness
- Blood dyscrasias
- Pruritus
- Photosensitivity
- Elevated blood glucose level
- Increased weight
- Impaired body temperature regulation
- Gynecomastia
- Lactation

4. Atypical antipsychotics are more effective for the negative symptoms of schizophrenia, such as avolition, apathy, and alogia.
5. The effects of antipsychotic medications are potentiated when given with other medications acting on the CNS.

B. Side and adverse effects (Box 69.9)

C. Extrapyramidal syndrome: Can include parkinsonism, dystonia, akathisia, or tardive dyskinesia (see Box 69.9)

D. Interventions
1. Monitor vital signs.
2. Monitor for symptoms of neuroleptic malignant syndrome (can occur with antipsychotic medications); refer to Section VIII.
3. Monitor urine output.
4. Monitor serum glucose level.
5. Administer the medication with food or milk to decrease gastric irritation.
6. For oral use, the liquid form might be preferred, because some clients hide tablets in their mouths to avoid taking them.
7. The absorption rate is faster with the liquid form of oral medication.
8. Avoid skin contact with the liquid concentrate to prevent contact dermatitis.
9. Protect the liquid concentrate from light.
10. Dilute the liquid concentrate with fruit juice.
11. Injectable form of risperidone is administered every 2 weeks for clients who have difficulty with medication adherence.
12. Inform the client that a full therapeutic effect of the medication may not be evident for 3 to 6 weeks after initiation of therapy; however, an observable therapeutic response may be apparent after 7 to 10 days.
13. Inform the client that some medications may cause a harmless change in urine color to pinkish to red-brown.
14. Instruct the client to use sunscreen, hats, and protective clothing when outdoors.
15. Instruct the client to avoid alcohol or other CNS depressants, because these substances will allow more of the medication to enter the brain, causing feelings of depression and drowsiness, dizziness, slow and difficult breathing, confusion, and coma.
16. Instruct the client to change positions slowly to avoid orthostatic hypotension.
17. Instruct the client to report signs of agranulocytosis, including sore throat, fever, and malaise.
18. Instruct the client to report signs of liver dysfunction, including jaundice, malaise, fever, and right upper abdominal pain.
19. When discontinuing antipsychotics, the medication dosage should be reduced gradually to avoid sudden recurrence of psychotic symptoms.

! Monitor for extrapyramidal side and adverse effects in the client taking an antipsychotic medication.

VIII. Neuroleptic Malignant Syndrome

A. Description
1. A potentially fatal syndrome that may occur at any time during therapy with neuroleptic (antipsychotic) medications (typically with first-generation antipsychotics)
2. Although rare, neuroleptic malignant syndrome most commonly occurs at the initiation of therapy, after the client has changed from one medication to another, after a dosage increase, or when a combination of medications is used.

B. Assessment
1. Dyspnea or tachypnea
2. Tachycardia or irregular pulse rate
3. Autonomic dysfunction
   - **a.** Hyperpyrexia
   - **b.** Hypertension
   - **c.** Tachycardia
   - **d.** Tachypnea
   - **e.** Diaphoresis
   - **f.** Drooling
4. High or low blood pressure
5. Excessive weakness or fatigue
6. Altered level of consciousness
7. Seizures
8. Severe extrapyramidal side and adverse effects
9. Skeletal muscle rigidity
10. Difficulty swallowing

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

11. Oculogyric crisis
12. Elevated white blood cell count, liver function results, and creatine phosphokinase level

C. Interventions
1. Notify the PHCP.
2. Monitor vital signs.
3. Initiate safety and seizure precautions.
4. Prepare to discontinue the medication.
5. Monitor level of consciousness.
6. Administer antipyretics as prescribed.
7. Use a cooling blanket to lower the body temperature.
8. Monitor electrolyte levels, and administer fluids intravenously as prescribed.
9. Monitor for complications, such as deep vein thrombosis (DVT) and rhabdomyolysis.

IX. Medications to Treat Alcohol Withdrawal

A. Benzodiazepines
1. Medications include chlordiazepoxide, clorazepate, diazepam, lorazepam, and oxazepam.
2. These are the most effective medications to facilitate alcohol withdrawal.
3. These can stabilize vital signs, reduce symptom intensity, and decrease the risk of seizures and delirium tremens.
4. Although all benzodiazepines are effective, agents with longer half-lives are preferred because they provide the greatest protection against seizures and breakthrough symptoms.
5. Side effects include drowsiness, loss of coordination, headache, blurred vision, and constipation.
6. These medications should not be taken concurrently with opioid pain medications, muscle relaxants, or alcohol.
7. Drinking alcohol with benzodiazepines greatly increases the risk of a lethal overdose.

B. Beta-adrenergic blockers
1. Medications include atenolol and propranolol.
2. Used to improve vital signs, decrease cravings, and decrease autonomic components of withdrawal symptoms
3. These should always be used as an adjunct to benzodiazepines.
4. Side effects include fatigue, dizziness, lightheadedness, cold fingers and toes, and nausea.

C. Central alpha-adrenergic agonist
1. Medications include clonidine.
2. Used to decrease the autonomic component of withdrawal symptoms
3. These should always be used as an adjunct to benzodiazepines.
4. Side effects include fatigue, dizziness, irritability, and dry mouth.

D. Vitamins
1. Intramuscular injection of vitamin B_1 (thiamine) followed by several days of oral administration is usually prescribed to prevent Wernicke's encephalopathy.
2. Vitamins are usually prescribed (multivitamin, vitamin B complex including thiamine, folic acid, and vitamin C).
3. Magnesium is prescribed if the client has hypomagnesemia.

E. Maintaining Abstinence
1. Medications can be prescribed to clients to help maintain abstinence.
2. These medications should be prescribed only to clients who have stopped drinking alcohol and are not actively experiencing withdrawal symptoms.
3. Naltrexone: Works by blocking in the brain the "high" feeling that people experience when they drink alcohol
4. Acamprosate: Works by reducing the physical distress and emotional discomfort people usually experience when they quit drinking
5. Disulfiram: Works by causing a severe adverse reaction when someone taking the medication consumes alcohol (Box 69.10).

BOX 69.10 Disulfiram Therapy

Adverse Effects that Occur when Drinking Alcohol while Taking Disulfiram
- Fatigue
- Facial flushing
- Sweating
- Throbbing headache
- Nausea and vomiting
- Hypotension
- Tachycardia

Client Education
- Ensure agreement to abstain from alcohol and any alcohol-containing substances.
- Educate clients that they must abstain from alcohol for at least 12 hours before the initial dose.
- Educate about the effects of the medication, including that effects usually begin within several minutes after consuming alcohol and may last 30 minutes to 2 hours.
- Inform clients that effects of the medication may occur for several days after it is discontinued.

Instruct the client who is on disulfiram therapy to avoid the use of substances that contain alcohol, such as cough medicines, rubbing compounds, vinegar, mouthwashes, and aftershave lotions. The client needs to read the labels of all products.

X. Medications to Treat Opioid Use Disorder

A. Methadone
1. This is an opioid agonist and consists of transferring the client from the abused opioid to oral methadone.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Methadone helps the client avoid withdrawal symptoms.
3. Methadone treatment is done only under close supervision by medical professionals because there is a risk of overdosing.
4. Side effects include constipation, lightheadedness or dizziness, fatigue, nausea or vomiting, confusion, forgetfulness, and impaired balance and coordination.
5. Symptoms of overdose include bradypnea, bluish skin, extreme fatigue, stupor, and vomiting.
6. Overdosing can lead to coma and death.

B. Buprenorphine
1. This is an agonist-antagonist opioid and can be used for maintenance therapy and to facilitate detoxification.
2. Unlike methadone, which has many restrictions and must be closely monitored by a medical professional, buprenorphine can be prescribed and dispensed in general medical settings.
3. It has a low potential for abuse or overdose but still suppresses cravings for opioids.
4. Side effects include constipation, headache, fatigue or drowsiness, loss of appetite, and nausea.

C. Naltrexone
1. This is an opioid antagonist that can be used to discourage renewed opioid abuse after a client has undergone opioid detoxification.
2. It blocks the euphoria and all other opioid-induced effects.
3. Once the client learns that opioids cannot produce the desired response while the client is taking this medication, the drug-using behavior should decrease or cease.
4. Side effects include nausea and vomiting, difficulty sleeping, abdominal pain, fatigue, anxiety, and headaches.

D. Clonidine
1. Used to decrease the autonomic component of withdrawal symptoms
2. Side effects include fatigue, dizziness, irritability, and dry mouth.

XI. Medications to Treat Attention-Deficit/Hyperactivity Disorder (Box 69.11)

A. Children with attention-deficit/hyperactivity disorder may require medication to reduce hyperactive behavior and lengthen attention span.

B. Medications that are most effective in controlling this disorder are CNS stimulants.

C. CNS stimulants, which increase agitation and activity in adults, have a calming effect on children with attention-deficit/hyperactivity disorder and increase alertness and sensitivity to stimuli.

D. Side and adverse effects
1. Tachycardia
2. Anorexia and weight loss
3. Elevated blood pressure
4. Dizziness
5. Agitation

BOX 69.11 Medications to Treat Attention-Deficit/Hyperactivity Disorder

- Amphetamine
- Atomoxetine
- Dexmethylphenidate
- Dextroamphetamine
- Dextroamphetamine and amphetamine
- Guanfacine
- Lisdexamfetamine
- Methylphenidate

E. Interventions
1. Monitor for CNS side and adverse effects.
2. Obtain a baseline ECG.
3. Monitor the blood pressure.
4. Instruct the child and parents that OTC medications need to be avoided.
5. Instruct the child and parents that the last dose of the day should be taken at least 6 hours before bedtime (14 hours for extended-release forms) to prevent insomnia.
6. Monitor height and weight (particularly in children).
7. Reinforce that several weeks of therapy may be necessary before the therapeutic effect is noted.
8. Instruct the client and parents that a medication-free period may be prescribed to demonstrate the continued need for the medication and temporarily remove side effects of the medication, which commonly include sleep delay, appetite suppression, and tolerance to treatment.

XII. Medications to Treat Alzheimer's Disease (Box 69.12)

A. Acetylcholinesterase inhibitors may be used in clients with Alzheimer's disease to improve cognitive functions in the early stages.

B. Donepezil
1. An inhibitor of acetylcholinesterase used to treat mild to moderate dementia of Alzheimer's disease
2. Side and adverse effects include nausea and diarrhea.
3. Donepezil can slow the heart rate through its vagotonic effect.

C. Galantamine
1. An inhibitor of cholinesterase used to treat mild to moderate dementia of Alzheimer's disease
2. Side and adverse effects include nausea, vomiting, diarrhea, anorexia, and weight loss.
3. Galantamine can cause bronchoconstriction; it should be used with caution in clients with asthma and chronic obstructive pulmonary disease.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 69.12 Medications to Treat Alzheimer's Disease

- Donepezil
- Galantamine
- Memantine
- Rivastigmine

D. Memantine
1. *N*-Methyl-D-aspartate (NMDA) receptor antagonist indicated for treatment of moderate to severe dementia of Alzheimer's disease
2. Side and adverse effects include dizziness, headache, confusion, and constipation.
3. Memantine should not be used in combination with other NMDA receptor antagonists such as amantadine or ketamine; such combinations produce undesirable additive effects.
4. Sodium bicarbonate and other medications that alkalinize the urine can decrease renal excretion of memantine; accumulation to toxic levels can result.
5. Clearance is reduced with renal impairment; therefore, use with caution.

E. Rivastigmine
1. Cholinesterase inhibitor used to treat mild to moderate dementia of Alzheimer's disease
2. Side and adverse effects include nausea, vomiting, diarrhea, anorexia, and weight loss.
3. It should be taken with food to reduce gastrointestinal side effects.
4. Rivastigmine should be used with caution in clients with peptic ulcer disease, bradycardia, sick sinus syndrome, urinary obstruction, and lung disease because it enhances cholinergic transmission, intensifying symptoms of these disorders.

PRACTICE QUESTIONS

1. A client's medication sheet contains a prescription for sertraline. To ensure safe administration of the medication, how would the nurse administer the dose?
1. On an empty stomach
2. At the same time each evening
3. Evenly spaced around the clock
4. As needed when the client complains of depression

2. A client with schizophrenia has been started on medication therapy with clozapine. The nurse would assess the results of which laboratory study to monitor for adverse effects from this medication?
1. Platelet count
2. Blood glucose level
3. Liver function studies
4. White blood cell count

3. A client is scheduled for discharge and will be taking phenobarbital for an extended period. The nurse would place **highest priority** on teaching the client which point that directly relates to client safety?
1. Take the medication only with meals.
2. Take the medication at the same time each day.
3. Use a dose container to help prevent missed doses.
4. Avoid drinking alcohol while taking this medication.

4. The nurse is describing the medication side and adverse effects to a client who is taking amitriptyline. Which information would the nurse incorporate in the discussion?
1. Consume a low-fiber diet.
2. Increase fluids and bulk in the diet.
3. Rest if the heart begins to beat rapidly.
4. Walk if you have difficulty urinating because this is a normal side effect.

5. The nurse is administering risperidone to a client with schizophrenia who is scheduled to be discharged. Before discharge, which instruction would the nurse provide to the client?
1. Get adequate sunlight.
2. Continue driving as usual.
3. Avoid foods rich in potassium.
4. Get up slowly when changing positions.

6. The nurse is teaching a client who is being started on imipramine about the medication. The nurse would inform the client to expect maximum desired effects at which time period following initiation of the medication?
1. In 2 months
2. In 2 to 3 weeks
3. During the first week
4. During the sixth week of administration

7. A hospitalized client is started on a monoamine oxidase inhibitor (MAOI) for the treatment of depression. The nurse would instruct the client that which foods are acceptable to consume while taking this medication? **Select all that apply.**
- ❑ 1. Figs
- ❑ 2. Yogurt
- ❑ 3. Crackers
- ❑ 4. Aged cheese
- ❑ 5. Tossed salad
- ❑ 6. Oatmeal raisin cookies

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

8. The nurse notes that a client with schizophrenia who is receiving an antipsychotic medication is moving the mouth, protruding the tongue, and grimacing while watching television. The nurse determines that the client is experiencing which medication complication?
   1. Parkinsonism
   2. Tardive dyskinesia
   3. Hypertensive crisis
   4. Neuroleptic malignant syndrome

9. The nurse is performing a follow-up teaching session with a client discharged 1 month ago. The client is taking fluoxetine. Which information would be important for the nurse to obtain during this client visit regarding specific side and adverse effects of the medication?
   1. Renal dysfunctions
   2. Gastrointestinal dysfunctions
   3. Problems with mouth dryness
   4. Problems with excessive sweating

10. A client who has been taking buspirone for 1 month returns to the clinic for a follow-up assessment. The nurse determines that the medication is **effective** if the absence of which manifestation has occurred?
   1. Paranoid thought process
   2. Rapid heartbeat or anxiety
   3. Alcohol withdrawal symptoms
   4. Thought broadcasting or delusions

11. A client taking lithium reports vomiting, abdominal pain, diarrhea, blurred vision, tinnitus, and tremors. The lithium level is 2.5 mEq/L (2.5 mmol/L). The nurse plans care based on which representation of this level?
   1. Toxic
   2. Normal
   3. Slightly above normal
   4. Excessively below normal

12. A client gives the home health nurse a bottle of clomipramine. The nurse notes that the medication has not been taken by the client in 2 months. Which behavior observed in the client would validate noncompliance with this medication?
   1. Complaints of insomnia
   2. Complaints of hunger and fatigue
   3. A pulse rate of less than 60 beats per minute
   4. Frequent handwashing with hot, soapy water

13. A hospitalized client has begun taking bupropion as an antidepressant agent. The nurse determines that which is an adverse effect, indicating that the client is taking an excessive amount of medication?
   1. Constipation
   2. Seizure activity
   3. Increased weight
   4. Dizziness when getting upright

14. A client receiving tricyclic antidepressants arrives at the mental health clinic. Which observation would indicate that the client is following the medication plan correctly?
   1. Client reports not going to work for the past week.
   2. Client complains of not being able to "do anything" anymore.
   3. Client arrives at the clinic neat and appropriate in appearance.
   4. Client reports sleeping 12 hours per night and 3 to 4 hours during the day.

ANSWERS

1. *Answer:* 2

Rationale: Sertraline is classified as an antidepressant. Sertraline generally is administered once every 24 hours. It may be administered in the morning or evening, but evening administration may be preferable because drowsiness is a side effect. The medication may be administered without food or with food if gastrointestinal distress occurs. Sertraline is not prescribed for use as needed.

Test-Taking Strategy: Focus on the subject, administration of sertraline. Recalling that this medication is an antidepressant administered daily will direct you to the correct option.

Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed.). St. Louis: Elsevier. pp. 360, 373.

2. *Answer:* 4

Rationale: A client taking clozapine may experience agranulocytosis, which is monitored by reviewing the results of the white blood cell count. Treatment is interrupted if the white blood cell count decreases to less than 3000 mm^3 (3×10^9/L). Agranulocytosis could be fatal if undetected and untreated. The other laboratory studies are not related specifically to the use of this medication.

Test-Taking Strategy: Focus on the subject, complications associated with clozapine. It is necessary to recall that this

Telegram & Insta: NCLEX_RN_Edu

medication causes agranulocytosis; this will direct you to the correct option.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. pp. 262-263.

3. *Answer:* 4
Rationale: Phenobarbital is an anticonvulsant and hypnotic agent. The client should avoid taking any other central nervous system depressants such as alcohol while taking this medication. The medication may be given without regard to meals. Taking the medication at the same time each day enhances compliance and maintains more stable blood levels of the medication. Using a dose container or "pillbox" may be helpful for some clients.
Test-Taking Strategy: Focus on the **subject,** client safety, and note the **strategic words,** *highest priority*. Eliminate option 1 because of the **closed-ended word** *only*. Although options 2 and 3 are correct teaching points, these are not the highest priority from the options provided. Remember that alcohol should not be consumed when a hypnotic is taken because of its adverse effects.
Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed). St. Louis: Elsevier. pp. 238, 248-249.

4. *Answer:* 2
Rationale: Amitriptyline causes constipation, and the client is instructed to increase fluid intake and bulk (high fiber) in the diet. If the heart begins to beat fast, the primary health care provider (PHCP) is notified, because this could indicate an adverse effect. Difficulty urinating is an adverse effect and indicates urinary retention; this should also be reported.
Test-Taking Strategy: Focus on the **subject,** side and adverse effects of amitriptyline. Recalling that constipation is a side effect of this medication will direct you to the correct option.
Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. p. 66.

5. *Answer:* 4
Rationale: Risperidone can cause orthostatic hypotension. Sunlight should be avoided by clients taking this medication. With any psychotropic medication, individuals need to take caution with driving or other activities requiring alertness until they can determine whether their level of alertness is affected. Food interaction is not a concern.
Test-Taking Strategy: Focus on the **subject,** parameters to monitor for the client taking risperidone. It is necessary to know the nursing considerations related to the administration of risperidone and that risperidone can cause orthostatic hypotension. Also, use of the **ABCs—airway, breathing, and circulation**—will direct you to the correct option.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. pp. 263-264.

6. *Answer:* 2
Rationale: The maximum therapeutic effects of imipramine may not occur for 2 to 3 weeks after antidepressant therapy has been initiated. Options 1, 3, and 4 are incorrect time periods.
Test-Taking Strategy: Note the **subject,** the desired effect of this medication, and focus on the word *maximum*. Recalling that it takes 2 to 3 weeks for a maximum therapeutic effect to occur with most antidepressants will direct you to the correct option.
Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. p. 674.

7. *Answer:* 3, 5
Rationale: With MAOIs, the client should avoid ingesting foods that are high in tyramine. Ingestion of these foods could trigger a potentially fatal hypertensive crisis. Foods to avoid include yogurt; aged cheeses; smoked or processed meats; red wines; and fruits such as avocados, raisins, or figs.
Test-Taking Strategy: Focus on the **subject,** acceptable food items while taking MAOIs. Recall that with MAOIs, foods high in tyramine need to be avoided. Next, from the food items listed in the question, identify the foods that are tyramine-free.
Reference: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. p. 256.

8. *Answer:* 2
Rationale: Tardive dyskinesia is a reaction that can occur from antipsychotic medication. It is characterized by uncontrollable involuntary movements of the body and extremities, particularly the tongue. Parkinsonism is characterized by tremors, masklike facies, rigidity, and a shuffling gait. Hypertensive crisis can occur from the use of monoamine oxidase inhibitors and is characterized by hypertension, occipital headache radiating frontally, neck stiffness and soreness, nausea, and vomiting. Neuroleptic malignant syndrome is a potentially fatal syndrome that may occur at any time during therapy with neuroleptic (antipsychotic) medications. It is characterized by dyspnea or tachypnea, tachycardia or irregular pulse rate, fever, blood pressure changes, increased sweating, loss of bladder control, and skeletal muscle rigidity.
Test-Taking Strategy: Focus on the **subject,** a complication of antipsychotic medications. To direct you to the correct option, remember that tardive dyskinesia is characterized by uncontrollable involuntary movements of the body and extremities, particularly the tongue.
References: Lilley, L., Rainforth Collins, S., & Snyder, J. (2020). *Pharmacology and the nursing process.* (9th ed.). St. Louis: Elsevier. p. 260; Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 271-272.

9. *Answer:* 2
Rationale: Specific side and adverse effects related to fluoxetine include central nervous system and gastrointestinal system dysfunction. Fluoxetine affects the gastrointestinal system by causing nausea and vomiting, cramping, and diarrhea. Renal dysfunctions, dry mouth, and excessive sweating are not side and adverse effects associated with this medication.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Test-Taking Strategy: Focus on the **subject,** specific side and adverse effects of fluoxetine. It is necessary to remember that this medication causes gastrointestinal problems. This will direct you to the correct option.
References: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed.). St. Louis: Elsevier. pp. 373-374; Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. p. 564.

10. *Answer:* 2
Rationale: Buspirone is not recommended for the treatment of paranoid thought disorders, drug or alcohol withdrawal, or schizophrenia. Buspirone most often is indicated for the treatment of anxiety.
Test-Taking Strategy: Note the **strategic word,** *effective*. Note the words *absence of which manifestation* in the question. Recalling that buspirone is an antianxiety medication will direct you to the correct option.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. pp. 45, 152-153.

11. *Answer:* 1
Rationale: Maintenance serum levels of lithium are 0.6 to 1.2 mEq/L (0.6 to 1.2 mmol/L). Symptoms of toxicity begin to appear at levels of 1.5 mEq/L (1.5 mmol/L). Lithium toxicity requires immediate medical attention and the primary health care provider is notified if symptoms of toxicity occur.
Test-Taking Strategy: Focus on the **subject,** therapeutic serum medication level of lithium. Recalling that the high end of the maintenance level is 1.2 mEq/L (1.2 mmol/L) will direct you to the correct option.
Reference: Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 240.

12. *Answer:* 4
Rationale: Clomipramine is a tricyclic antidepressant used to treat obsessive-compulsive disorder. Sedation sometimes occurs. Insomnia seldom is a side effect. Weight gain and tachycardia are side and adverse effects of this medication.
Test-Taking Strategy: Focus on the **subject,** noncompliance with clomipramine. Recalling that this medication is a tricyclic antidepressant used to treat obsessive-compulsive disorder will direct you to the correct option.
Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference.* (34th ed.). St. Louis: Elsevier. pp. 300-301.

13. *Answer:* 2
Rationale: Seizure activity can occur in clients taking bupropion dosages greater than 450 mg daily. Weight gain is an occasional side effect, whereas constipation is a common side effect of this medication. This medication does not cause significant orthostatic blood pressure changes.
Test-Taking Strategy: Focus on the **subject,** signs of toxicity associated with bupropion. Note the words *excessive amount*. These words will direct you to the correct option, the one that identifies the most serious concern.
Reference: Kizior, R., & Hodgson, B. (2022). *Saunders nursing drug handbook 2022*. St. Louis: Elsevier. pp. 165-167.

14. *Answer:* 3
Rationale: Depressed individuals sleep for long periods, are unable to go to work, and feel as if they cannot "do anything." When these clients have had some therapeutic effect from their medication, they report resolution of many of these complaints and exhibit an improvement in their appearance. Options 1, 2, and 4 identify continued depression.
Test-Taking Strategy: The client's behaviors or reports identified in options 1, 2, and 4 are **comparable or alike** and are symptoms of depression. The improvement in appearance indicates a therapeutic response to the medication, indicating compliance with the medication regimen.
References: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care.* (10th ed). St. Louis: Elsevier. p. 372; Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care.* (4th ed.). St. Louis: Elsevier. p. 219.

UNIT XIX

Complex Care

Pyramid to Success

Pyramid points focus on intravenous (IV) therapies, including intravenous fluids and parenteral nutrition, administration of blood products, care of the client with a tube, and complex problems involving the integumentary, hematological, oncological, endocrine, gastrointestinal, respiratory, cardiovascular, renal and urinary, neurological, and immune systems. The different types of shock are discussed with a focus on sepsis, systemic inflammatory response syndrome, multiple organ dysfunction syndrome, septic shock, and hemodynamic management. Sedation, agitation, and delirium are discussed. These concepts are potential topics on the NCLEX®. With regard to IV therapy, assessment of the client for allergies, including latex sensitivity, initiation of an IV line, and monitoring for complications are critical nursing responsibilities. Likewise, the procedure for administering blood components, the signs and symptoms of transfusion reaction, and the immediate interventions if a transfusion reaction occurs are a focus. Care of the client with a tube such as a gastrointestinal tube or chest tube have varying indications, considerations, and associated nursing interventions and these are presented. Specific complex health problems requiring decision making and clinical judgment and a high-level of nursing care are discussed in detail, as well as the associated assessment findings and nursing interventions.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

Applying principles of infection control
Collaborating with interprofessional health care members in the care of a client with a complex health problem
Ensuring that informed consent has been obtained for invasive procedures and for the administration of blood products
Establishing safety prior to the administration of a blood product
Following guidelines regarding the use of invasive devices
Following guidelines for asepsis procedures
Handling hazardous and infectious materials to prevent injury to health care personnel and others
Maintaining confidentiality
Maintaining precautions to prevent errors, accidents, and injury
Prioritizing hypotheses for the plan of care
Protecting the medicated client from injury
Recognizing cues that identify a safety hazard for the client
Taking actions to ensure safety
Using equipment safely
Using standard and transmission-based precautions per protocol of the Centers for Disease Control and Prevention (CDC)
Using clinical judgment when making decisions about the care of a client to ensure a safe environment

Health Promotion and Maintenance

Considering lifestyle choices for home care needs related to the health problem
Generating solutions regarding a plan of care for prescribed medications or IV therapy
Providing client and family education regarding the administration of parenteral nutrition at home

Telegram & Insta: NCLEX_RN_Edu

Providing health and wellness teaching to prevent complications
Recognizing cues that indicate the client is able to care for self
Responding to lifestyle choices related to receiving a blood transfusion
Teaching the client and family about home care related to the health problem
Teaching the client to monitor for signs and symptoms that indicate the need to notify the primary health care provider

Psychosocial Integrity

Assessing the client and family emotional response to treatment
Discussing role changes and alterations in lifestyle related to the client's needs and health problems
Facilitating client and family coping
Identifying cultural and spiritual factors influencing health
Keeping the family informed of client progress as appropriate
Providing emotional support to the client and significant others
Promoting an environment that will allow the client to express concerns
Recognizing cues that indicate the need for support systems

Physiological Integrity

Administering blood products safely
Administering medications and IV therapy safely
Analyzing cues that indicate a potential complication
Assessing and caring for central venous access devices
Documenting the client's response to complex care interventions
Evaluating outcomes of care for the client with complex health problems
Identifying client allergies and sensitivities
Managing a client with complex health problems involving multiple body systems
Managing a client with sepsis, systemic inflammatory response syndrome, multiple organ dysfunction syndrome, and septic shock
Managing sedation, agitation, and delirium safely
Monitoring for expected and unexpected effects of interventions and documenting findings
Monitoring of enteral feedings and the client's ability to tolerate feedings
Monitoring the client with an invasive device such as a chest tube and responding to changes in condition as necessary
Providing care to a client with a burn or inhalation injury
Providing interventions compatible with the client's age, cultural, spiritual and health care beliefs, education level, and language
Recognizing cues that indicate adverse effects of and contraindications to medication or IV therapy
Recognizing cues that indicate changes in the client's condition
Taking action and intervening appropriately when medical or surgical complications arise
Taking action to address hemodynamic changes in a critically ill client
Using special and invasive monitoring equipment safely

CHAPTER 70

Complex Care

Contributor: Esmeralda Araceli Clark, MSN, APRN, FNP-BC

PRIORITY CONCEPTS Clinical Judgment, Perfusion

I. Administration of Intravenous (IV) Fluids

A. Intravenous Therapy
1. Used to sustain clients who are unable to take substances orally
2. Replaces water, electrolytes, and nutrients more rapidly than oral administration
3. Provides immediate access to the vascular system for the rapid delivery of specific solutions without the time required for gastrointestinal tract absorption
4. Provides a vascular route for the administration of medication or blood components

B. Types of solutions (Table 70.1)

⚠ Lactated Ringer's solution contains potassium and should not be administered to clients with acute kidney injury or chronic kidney disease. Caution should be taken with clients who have severe liver disease since the liver plays a role in converting lactate to bicarbonate in the liver.

1. Isotonic solutions
   - **a.** Have the same osmolality as body fluids
   - **b.** Increase extracellular fluid volume
   - **c.** Do not enter the cells because no osmotic force exists to shift the fluids
2. Hypotonic solutions
   - **a.** Are more dilute solutions and have a lower osmolality than body fluids
   - **b.** Cause the movement of water into cells by osmosis
   - **c.** Should be administered slowly to prevent cellular edema
3. Hypertonic solutions
   - **a.** Are more concentrated solutions and have a higher osmolality than body fluids
   - **b.** Cause movement of water from cells into the extracellular fluid by osmosis
4. Colloids
   - **a.** Also called plasma expanders
   - **b.** Pull fluid from the interstitial compartment into the vascular compartment
   - **c.** Used to increase the vascular volume rapidly, such as in hemorrhage or severe hypovolemia; generally used as a second-line treatment due to the potential for harmful side effects such as acute kidney injury

⚠ Administration of an intravenous (IV) solution or medication provides immediate access to the vascular system. This is a benefit of administering solutions or medications via this route, but it can also present a risk. Therefore, it is critical to ensure that the primary health care provider's (PHCP's) prescriptions are checked carefully and that the correct solution or medication is administered as prescribed. Always follow the rights for medication administration.

C. Intravenous devices
1. Butterfly sets
   - **a.** The set is a wing-tip needle with a metal cannula, plastic or rubber wings, and a plastic catheter or hub.
   - **b.** The needle is 0.5 to 1.5 inches in length, with needle gauge sizes from 16 to 26.
   - **c.** Infiltration is more common with these devices.
   - **d.** The butterfly infusion set is used commonly in children and older clients, whose veins are likely to be small or fragile.
2. Plastic cannulas: Used primarily for short-term therapy

D. IV gauges
1. The gauge refers to the diameter of the lumen of the needle or cannula.

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.1 Types of Intravenous Solutions

Solution and Type	Uses
0.9% saline (NS): Isotonic	Extracellular fluid deficits in clients with low serum levels of sodium or chloride and metabolic acid–base imbalances. Used before or after the infusion of blood products.
Ringer's lactate solution: Isotonic	Extracellular fluid deficits, such as fluid loss from burns, bleeding, and dehydration from loss of bile or diarrhea.
5% dextrose in water (D_5W): Isotonic at the time of administration; within a short time after administration, dextrose is metabolized and the tonicity decreases in proportion to the osmolarity or tonicity of the nondextrose components (electrolytes) within the water (may become hypotonic).	Replaces deficits of total body water. Not used alone to expand extracellular fluid volume because dilution of electrolytes can occur.
5% dextrose in 0.225% saline (5% D/¼NS): Isotonic at the time of administration; within a short time after administration, dextrose is metabolized and the tonicity decreases in proportion to the osmolarity or tonicity of the nondextrose components (electrolytes) within the water (may become hypertonic).	Used as initial fluid for hydration because it provides more water than sodium. Commonly used as maintenance fluid.
5% dextrose in 0.9% saline (5% D/NS): Hypertonic	Extracellular fluid deficits in clients with low serum levels of sodium or chloride and metabolic alkalosis.
5% dextrose in 0.45% saline (5% D/½ NS): Hypertonic	Used as initial fluid for hydration because it provides more water than sodium. Commonly used as maintenance fluid.
5% dextrose in Ringer's lactate solution: Hypertonic	Extracellular fluid deficits, such as fluid loss from burns, bleeding, and dehydration from loss of bile or diarrhea.

2. The smaller the gauge number, the larger the diameter of the lumen; the larger the gauge number, the smaller the diameter of the lumen.
3. The size of the gauge used depends on the solution to be administered and the diameter of the available vein.
4. Large-diameter lumens (smaller gauge numbers) allow a higher fluid rate than do smaller-diameter lumens and allow the administration of higher concentrations of solutions.
5. For rapid emergency fluid administration, blood products, or anesthetics, in preoperative and postoperative clients, large-diameter lumens are used, such as a 16- or 18-gauge lumen.
6. For peripheral **fat emulsion (lipids)** infusions, a 20- or 22-gauge lumen or cannula is used.
7. For standard IV fluid and clear liquid IV medications, a 22- or 24-gauge lumen or cannula is used.
8. If the client has very small veins, a 24- to 26-gauge lumen or cannula is used.

⚠ Monitor a client with diabetes mellitus who is receiving dextrose (glucose) solutions because the solution can increase the blood glucose level.

E. IV containers
1. Container is usually plastic; some solutions are in glass containers.
2. Squeeze the plastic bag to ensure intactness or assess the glass bottle for any cracks before hanging.
3. In most agencies, the pharmacy department prepares solutions containing medication; in some situations the nurse needs to reconstitute the medication. Agency protocol and pharmacy instruction should always be followed.

⚠ Do not write on a plastic IV bag with a marking pen, because the ink may be absorbed through the plastic into the solution. Use a label and a ballpoint pen for writing on the label, placing the label onto the bag.

F. IV tubing (Fig. 70.1)
1. IV tubing contains a spike end for the bag or bottle, drip chamber, roller clamp, Y site, and adapter end for attachment to the cannula that is inserted into the client's vein.
2. Shorter, secondary tubing is used for piggyback solutions, connecting them to the injection sites nearest to the drip chamber (Fig. 70.2).
3. Special tubing is used for medication that absorbs into plastic (check specific medication administration guidelines when administering IV medications).
4. Vented and nonvented tubing are available.
   a. A vent allows air to enter the IV container as the fluid leaves.
   b. A vented adapter can be used to add a vent to a nonvented IV tubing system.
   c. Use nonvented tubing for flexible containers.
   d. Use vented tubing for glass or rigid plastic containers to allow air to enter and displace the fluid as it leaves; fluid will not flow from a rigid IV container unless it is vented.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

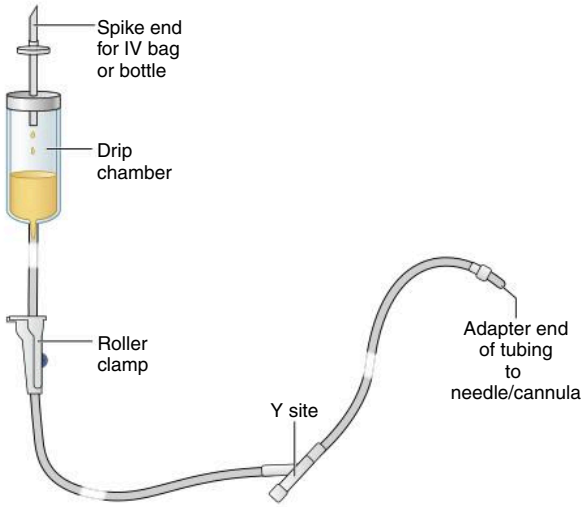

FIG. 70.1 Intravenous (IV) tubing.

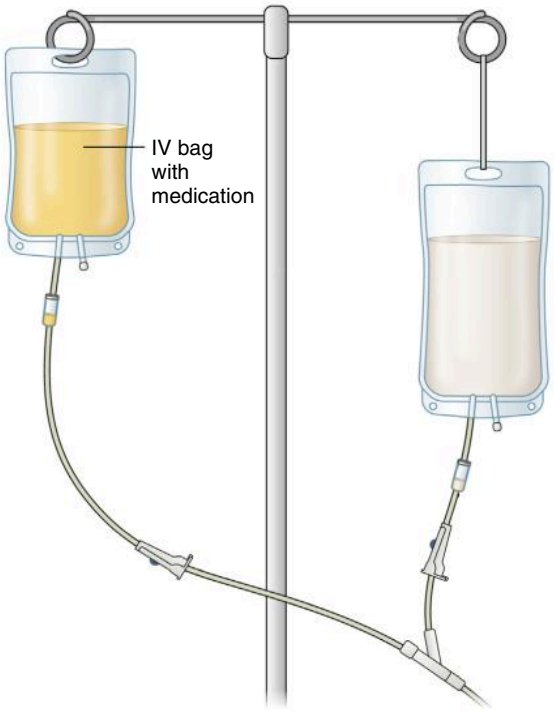

FIG. 70.2 Secondary bag with medication. *IV*, Intravenous.

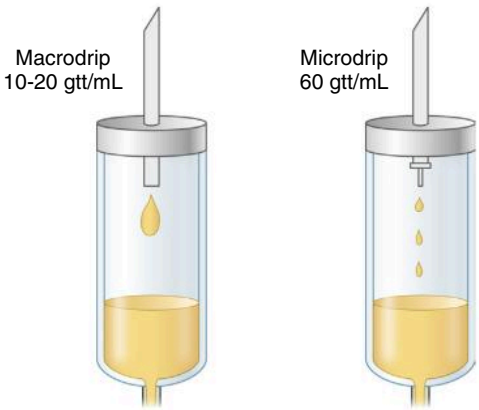

FIG. 70.3 Macrodrip and microdrip sizes.

Extension tubing can be added to an IV tubing set to provide extra length to the tubing. Add extension tubing to the IV tubing set for children, clients who are restless, or clients who have special mobility needs.

G. Drip chambers (Fig. 70.3)

1. Macrodrip chamber

a. The chamber is used if the solution is thick or is to be infused rapidly.

b. The drop factor varies from 10 to 20 drops (gtt)/mL, depending on the manufacturer.

c. Read the tubing package to determine how many drops per milliliter are delivered (drop factor).

2. Microdrip chamber

a. Normally, the chamber has a short vertical metal piece (stylet) where the drop forms.

b. The chamber delivers about 60 gtt/mL.

c. Read the tubing package to determine the drop factor (gtt/mL).

d. Microdrip chambers are used if fluid will be infused at a slow rate (less than 50 mL/hr) or if the solution contains potent medication that needs to be titrated, such as in a critical care setting or in pediatric clients.

H. Filters

1. Filters provide protection by preventing particles from entering the client's veins.

2. They are used in IV lines to trap small particles, such as undissolved substances or medications that have precipitated in solution.

3. Check the agency policy regarding the use of filters.

4. A 0.22-µm filter is used for most solutions; a 1.2-µm filter is used for solutions containing lipids or albumin; and a special filter is used for blood components.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

5. Change filters every 24 to 72 hours (depending on agency policy) to prevent bacterial growth.

I. Needleless infusion devices
   1. Needleless infusion devices include recessed needles, plastic cannulas, and one-way valves; these systems decrease the exposure to contaminated needles.
   2. Do not administer parenteral nutrition or blood products through a one-way valve.

J. Intermittent infusion devices
   1. Intermittent infusion devices are used when intravascular accessibility is desired for intermittent administration of medications by IV push or IV piggyback.
   2. Patency is maintained by periodic flushing with normal saline solution (*sodium chloride* and *normal saline* are interchangeable names).
   3. Depending on agency policy, when administering medication, flush with 1 to 2 mL of normal saline to confirm placement of the IV cannula; administer the prescribed medication and then flush the cannula again with 1 to 2 mL of normal saline to maintain patency.

K. Electronic IV infusion devices
   1. IV infusion pumps control the amount of fluid infusing and should be used with central venous lines, solutions containing medication, and parenteral nutrition infusions. Most agencies use IV pumps for the infusion of any IV solution.
   2. A syringe pump is used when a small volume of medication is administered; the syringe that contains the medication and solution fits into a pump and is set to deliver the medication at a controlled rate.
   3. Patient-controlled analgesia (PCA)
      a. A device that allows the client to self-administer IV medication, such as an analgesic; the client can administer doses at set intervals, and the pump can be set to lock out doses that are not within the preset time frame to prevent overdose.
      b. The PCA regimen may include a basal rate of infusion along with the demand dosing, basal rate infusion alone, or demand dosing alone.
      c. A bolus dose can be given prior to any of the settings and should be set based on the PHCP's prescription.
      d. PCAs are always kept locked, and setup requires the witness of another registered nurse (RN).

⚠ Check electronic IV infusion devices frequently. Although these devices are electronic, this does not ensure that they are infusing solutions and medications accurately.

L. Latex allergy
   1. Assess the client for an allergy to latex.

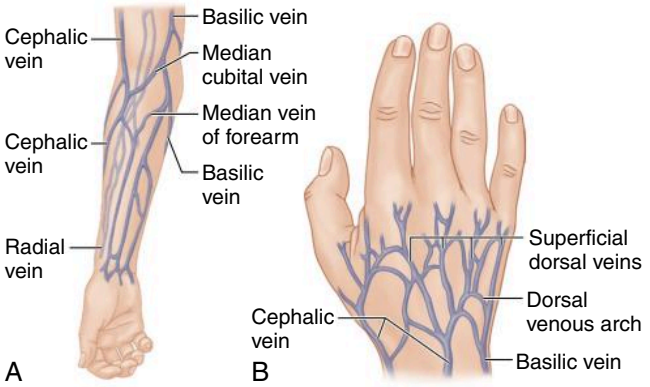

FIG. 70.4 Common intravenous sites. **A,** Inner arm. **B,** Dorsal surface of hand.

   2. IV supplies, including IV catheters, IV tubing, IV ports (particularly IV rubber injection ports), rubber stoppers on multidose vials, and adhesive tape, may contain latex.
   3. Latex-safe IV supplies need to be used for clients with a latex allergy; most agencies carry these types of supplies, but this still needs to be checked.
   4. See Chapter 63 for additional information regarding latex allergy.

M. Selection of a peripheral IV site
   1. Veins in the hand, forearm, and antecubital fossa are suitable sites (Fig. 70.4).
   2. Veins in the lower extremities (legs and feet) are not suitable for an adult client because of the risk of thrombus formation and the possible pooling of medication in areas of decreased venous return (Box 70.1).
   3. Veins in the scalp and feet may be suitable sites for infants.
   4. Assess the veins of both arms closely before selecting a site.
   5. Start the IV infusion distally to provide the option of proceeding up the extremity if the vein is ruptured or infiltration occurs; if infiltration occurs from the antecubital vein, the lower veins in the same arm usually should not be used for further puncture sites.
   6. Determine the client's dominant side, and select the opposite side for a **venipuncture** site.
   7. Bending the elbow on the arm with an IV may easily obstruct the flow of solution, causing infiltration that could lead to thrombophlebitis.
   8. Avoid checking the blood pressure on the arm receiving the IV infusion if possible.
   9. Do not place restraints over the venipuncture site.
   10. Use an armboard as needed when the venipuncture site is located in an area of flexion.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.1 Peripheral Intravenous Sites to Avoid

- Edematous extremity
- An arm that is weak, traumatized, or paralyzed
- The arm on the same side as a mastectomy
- An arm that has an arteriovenous fistula or shunt for dialysis
- A skin area that is infected

⚠ In an adult, the most frequently used sites for inserting an IV cannula or needle are the veins of the forearm, because the bones of the forearm act as a natural support and splint.

N. Initiation and administration of IV solutions

1. Check the IV solution against the PHCP's prescription for the type, amount, percentage of solution, and rate of flow; follow the rights for medication administration.
2. Assess the health status and medical disorders of the client and identify client conditions that contraindicate use of a particular IV solution or IV equipment, such as an allergy to cleansing solution, adhesive materials, or latex. Check compatibility of IV solutions as appropriate.
3. Check the client's identification by two identifiers and explain the procedure to the client; assess the client's previous experience with IV therapy and preference for insertion site.
4. Wash hands thoroughly before inserting an IV line and before working with an IV line; wear gloves.
5. Use sterile technique when inserting an IV line and when changing the dressing over the IV site.
6. Change the venipuncture site every 72 to 96 hours in accordance with the Centers for Disease Control and Prevention (CDC) recommendations and agency policy.
7. Change the IV dressing when the dressing is wet or contaminated, or as specified by the agency policy.
8. Change the IV tubing every 96 hours in accordance with CDC recommendations and agency policy or with a change of the venipuncture site.
9. Do not let an IV bag or bottle of solution hang for more than 24 hours, to diminish the potential for bacterial contamination and possibly sepsis.
10. Do not allow the IV tubing to touch the floor, to prevent potential bacterial contamination.
11. See Box 70.2 for instructions on inserting an IV.
12. See Box 70.3 for instructions on removing an IV.

O. Precautions for IV lines

1. On insertion, an IV line can cause initial pain and discomfort for the client.

BOX 70.2 Inserting a Peripheral Intravenous Line

1. Check the PHCP's prescription, determine the type and size of infusion device, and prepare intravenous (IV) tubing or extension set and solution; prime IV tubing or extension set to remove air from the system; explain procedure to the client.
2. Select the vein for insertion based on vein quality, client size, and indication of IV therapy; apply tourniquet and palpate the vein for resilience (see Fig. 70.4).
3. Clean the skin with an antimicrobial solution, using an inner to outer circular motion or as specified by the Centers for Disease Control and Prevention (CDC) guidelines and agency policy.
4. Stabilize the vein below the insertion site and puncture the skin and vein, observing for blood in the flashback chamber; when observed, lower the catheter so that it is flush with the skin and advance the catheter into the vein (if unsuccessful, a new sterile device is used for the next attempt at insertion).
5. Remove the tourniquet. Apply pressure above the insertion site with the middle finger of the nondominant hand and retract the stylet from the catheter; connect the end of the IV tubing or extension set to the catheter tubing, secure it, and begin IV flow. Ask the client about comfort at the site and assess site for adequate flow.
6. Tape and secure the insertion site with a transparent dressing as specified by agency procedure; label the tubing, dressing, and solution bags clearly, indicating the date and time.
7. Document the specifics about the procedure, such as the number of attempts at insertion; the insertion site, type and size of device, solution and flow rate, and time; and the client's response. In addition, follow agency procedure for documentation of procedure.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1012-1013, 1017.

BOX 70.3 Removing a Peripheral Intravenous Line

1. Check the PHCP's prescription and explain the procedure to the client; ask the client to hold the extremity still during cannula or needle removal.
2. Turn off the intravenous (IV) tubing clamp and remove the dressing and tape covering the site, while stabilizing the catheter.
3. Apply light pressure with sterile gauze (or other material as specified by agency procedure) over the site, and withdraw the catheter using a slow, steady movement, keeping the hub parallel to the skin.
4. Apply pressure for 2 to 3 minutes, using dry sterile gauze (apply pressure for a longer period of time if the client has a bleeding disorder or is taking anticoagulant medication).
5. Inspect the site for redness, drainage, or swelling; check the catheter for intactness.
6. Apply a dressing as needed per agency policy.
7. Document the procedure and the client's response.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1012, 1030-1031.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. An IV puncture provides a route of entry for microorganisms into the body.
3. Medications administered by the IV route enter the blood immediately, and any adverse reactions or allergic responses can occur immediately.
4. Fluid (circulatory) overload or electrolyte imbalances can occur from excessive or too rapid infusion of IV fluids.
5. Incompatibilities between certain solutions and medications can occur.

Clients with respiratory, cardiac, renal, or liver disease; older clients; and very young persons are at risk for circulatory overload and cannot tolerate an excessive fluid volume. Also, a client with heart failure or renal failure usually is not given a solution containing saline, because this type of fluid promotes the retention of water and would therefore exacerbate heart failure or renal failure by increasing the fluid overload.

P. Complications of intravenous therapy (Table 70.2)

Always document the occurrence of a complication, assessment findings, actions taken, and the client's response, according to agency policy.

Q. Central venous catheters

1. Description
   - **a.** Central venous catheters (Fig. 70.5) are used to deliver hyperosmolar solutions, measure central venous pressure, infuse parenteral nutrition, or infuse multiple IV solutions or medications.
   - **b.** Catheter position is determined by radiography after insertion.
   - **c.** The catheter may have a single, double, or triple lumen.
   - **d.** The catheter may be inserted peripherally and threaded through the basilic or cephalic vein into the superior vena cava, inserted centrally through the internal jugular or subclavian veins, or surgically tunneled through subcutaneous tissue.

TABLE 70.2 Complications of Intravenous Therapy

Complication	Description	Signs or Symptoms	Prevention and Interventions
Air embolism	▪ A bolus of air enters the vein through an inadequately primed IV line, from a loose connection, during tubing change, or during removal of the IV.	▪ Tachycardia ▪ Chest pain and dyspnea ▪ Hypotension ▪ Cyanosis ▪ Decreased level of consciousness	▪ Prime tubing with fluid before use, and monitor for any air bubbles in the tubing. ▪ Secure all connections. ▪ Replace the IV fluid before the bag or bottle is empty. ▪ Monitor for signs of air embolism; if suspected, clamp the tubing, turn the client on the left side with the head of the bed lowered (Trendelenburg's position) to trap the air in the right atrium, and notify the PHCP.
Catheter embolism	▪ An obstruction that results from breakage of the catheter tip during IV line insertion or removal	▪ Decrease in blood pressure ▪ Pain along the vein ▪ Weak, rapid pulse ▪ Cyanosis of the nail beds ▪ Loss of consciousness	▪ Remove the catheter carefully. ▪ Inspect the catheter when removed. ▪ If the catheter tip has broken off, place a tourniquet as proximally as possible to the IV site on the affected limb, notify the PHCP immediately, prepare to obtain a radiograph, and prepare the client for surgery to remove the catheter piece(s), if necessary.
Circulatory overload	▪ Also known as *fluid overload;* results from the administration of fluids too rapidly, especially in a client at risk for fluid overload	▪ Increased blood pressure ▪ Distended jugular veins ▪ Rapid breathing ▪ Dyspnea ▪ Moist cough and crackles	▪ Identify clients at risk for circulatory overload. ▪ Calculate and monitor the drip (flow) rate frequently. ▪ Use an electronic IV infusion device, and frequently check the drip rate or setting (at least every hour for an adult). ▪ If an electronic infusion device is not being used, add a time tape (label) to the IV bag or bottle next to the volume markings; mark on the tape the expected hourly decrease in volume based on the mL/hr calculation. ▪ Monitor for signs of circulatory overload. ▪ If circulatory overload occurs, decrease the flow rate to a minimum, at a keep-vein-open rate; elevate the head of the bed; keep the client warm; assess lung sounds; assess for edema; and notify the PHCP.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.2 Complications of Intravenous Therapy—cont'd

Complication	Description	Signs or Symptoms	Prevention and Interventions
Electrolyte overload and imbalance	▪ An electrolyte overload leading to imbalance is caused by too rapid or excessive infusion or by use of an inappropriate IV solution.	▪ Signs/symptoms depend on the specific electrolyte imbalance.	▪ Assess laboratory value reports. ▪ Verify the correct solution. ▪ Calculate and monitor the flow rate. ▪ Use an electronic IV infusion device, and frequently check the drip rate or setting (at least every hour for an adult). Use a time tape label if an electronic infusion device is not being used. ▪ Per agency procedure, place a red medication sticker on the bag or bottle if a medication has been added to the IV solution. ▪ Monitor for signs of an electrolyte imbalance, and notify the PHCP if they occur.
Hematoma	▪ The collection of blood in the tissues after an unsuccessful venipuncture or after the venipuncture site is discontinued and blood continues to ooze into the tissue	▪ Ecchymosis, immediate swelling and leakage of blood at the site, and hard and painful lumps at the site	▪ When starting an IV, avoid piercing the posterior wall of the vein. ▪ Do not apply a tourniquet to the extremity immediately after an unsuccessful venipuncture. ▪ When discontinuing an IV, apply pressure to the site for 2-3 minutes and elevate the extremity; apply pressure longer for clients with a bleeding disorder or who are taking anticoagulants. ▪ If a hematoma develops, elevate the extremity and apply pressure and ice as prescribed. ▪ Document accordingly, including taking pictures of the IV site if indicated by agency policy.

Infection	▪ Infection occurs from the entry of microorganisms into the body through the venipuncture site.
	▪ Venipuncture interrupts the integrity of the skin, the first line of defense against infection.
	▪ The longer the therapy continues, the greater the risk for infection.
	▪ Infection can occur locally at the IV insertion site or systemically from the entry of microorganisms into the body.
	▪ At-risk clients:
	  ▪ Immunocompromised clients with diseases such as cancer, human immunodeficiency virus or acquired immunodeficiency syndrome, those receiving biological modifier response medications for treatment of autoimmune conditions, or status post organ transplant are at risk for infection.
	  ▪ Clients receiving treatments such as chemotherapy who have an altered or lowered white blood cell count are at risk for infection.
	  ▪ Older clients, because aging alters the effectiveness of the immune system, are at risk for infection.
	  ▪ Clients with diabetes mellitus are at risk for infection.
		▪ Local—redness, swelling, and drainage at the site
		▪ Systemic—chills, fever, malaise, headache, nausea, vomiting, backache, tachycardia
			▪ Assess the client for predisposition to or risk for infection.
			▪ Maintain strict asepsis when caring for the IV site.
			▪ Monitor for signs of local or systemic infection.
			▪ Monitor white blood cell counts.
			▪ Check fluid containers for cracks, leaks, cloudiness, or other evidence of contamination.
			▪ Change IV tubing every 96 hours in accordance with CDC recommendations or according to agency policy; change IV site dressing when soiled or contaminated and according to agency policy.
			▪ Label the IV site, bag or bottle, and tubing with the date and time to ensure that these are changed on time according to agency policy.
			▪ Ensure that the IV solution is not hanging for more than 24 hours.
			▪ If infection occurs, the PHCP is notified; discontinue the IV, and place the venipuncture device in a sterile container for possible culture.
			▪ Prepare to obtain blood cultures as prescribed if infection occurs, and document accordingly.
			▪ Restart an IV in the opposite arm to differentiate sepsis (systemic infection) from local infection at the IV site.
			▪ Document accordingly, including taking pictures of the IV site if indicated by agency policy.

Continued

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.2 Complications of Intravenous Therapy—cont'd

Complication	Description	Signs or Symptoms	Prevention and Interventions
Infiltration	▪ Infiltration is seepage of the IV fluid out of the vein and into the surrounding interstitial spaces. ▪ Infiltration occurs when an access device has become dislodged or perforates the wall of the vein or when venous backpressure occurs because of a clot or venospasm.	▪ Edema, pain, numbness, and coolness at the site; may or may not have a blood return	▪ Avoid venipuncture over an area of flexion. ▪ Anchor the cannula and a loop of tubing securely with tape. ▪ Use an armboard or splint as needed if the client is restless or active. ▪ Monitor the IV rate for a decrease or a cessation of flow. ▪ Evaluate the IV site for infiltration by occluding the vein proximal to the IV site. If the IV fluid continues to flow, the cannula is probably outside the vein (infiltrated); if the IV flow stops after occlusion of the vein, the IV device is still in the vein. ▪ Lower the IV fluid container below the IV site, and monitor for the appearance of blood in the IV tubing; if blood appears, the IV device is most likely in the vein. ▪ If infiltration has occurred, remove the IV device immediately; elevate the extremity and apply compresses (warm or cool, depending on the IV solution that was infusing and the PHCP's prescription and agency procedure) over the affected area. ▪ Do not rub an infiltrated area, which can cause hematoma. ▪ Document accordingly, including taking pictures of the IV site if indicated by agency policy.
Phlebitis and thrombophlebitis	▪ Phlebitis is an inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection. ▪ Phlebitis can cause the development of a clot (thrombophlebitis).	▪ Phlebitis: Heat, redness, tenderness at the site; not swollen or hard; intravenous infusion sluggish ▪ Thrombophlebitis: hard and cordlike vein; heat, redness, tenderness at site; intravenous infusion sluggish	▪ Use an IV cannula smaller than the vein, and avoid using very small veins when administering irritating solutions. ▪ Avoid using the lower extremities (legs and feet) as an access area for the IV. ▪ Avoid venipuncture over an area of flexion. ▪ Anchor the cannula and a loop of tubing securely with tape. ▪ Use an armboard or splint as needed if the client is restless or active. ▪ Change the venipuncture site every 72-96 hours in accordance with CDC recommendations and agency policy. ▪ If phlebitis occurs, remove the IV device immediately and restart it in the opposite extremity; notify the PHCP if phlebitis is suspected, and apply warm, moist compresses, as prescribed. ▪ If thrombophlebitis occurs, do not irrigate the IV catheter; remove the IV, notify the PHCP, and restart the IV in the opposite extremity. ▪ Document accordingly, including taking pictures if indicated by agency policy.
Tissue damage	▪ Tissues most commonly damaged include the skin, veins, and subcutaneous tissue. ▪ Tissue damage can be uncomfortable and can cause permanent negative effects. ▪ Extravasation is a form of tissue damage caused by the seepage of vesicant or irritant solutions into the tissues; this occurrence requires immediate PHCP notification so that treatment can be prescribed to prevent tissue necrosis.	▪ Skin color changes, sloughing of the skin, discomfort at the site	▪ Use a careful and gentle approach when applying a tourniquet. ▪ Avoid tapping the skin over the vein when starting an IV. ▪ Monitor for ecchymosis when penetrating the skin with the cannula. ▪ Assess for allergies to tape or dressing adhesives. ▪ Monitor for skin color changes, sloughing of the skin, or discomfort at the IV site. ▪ Notify the PHCP if tissue damage is suspected. ▪ Document accordingly, including taking pictures if indicated by agency policy.

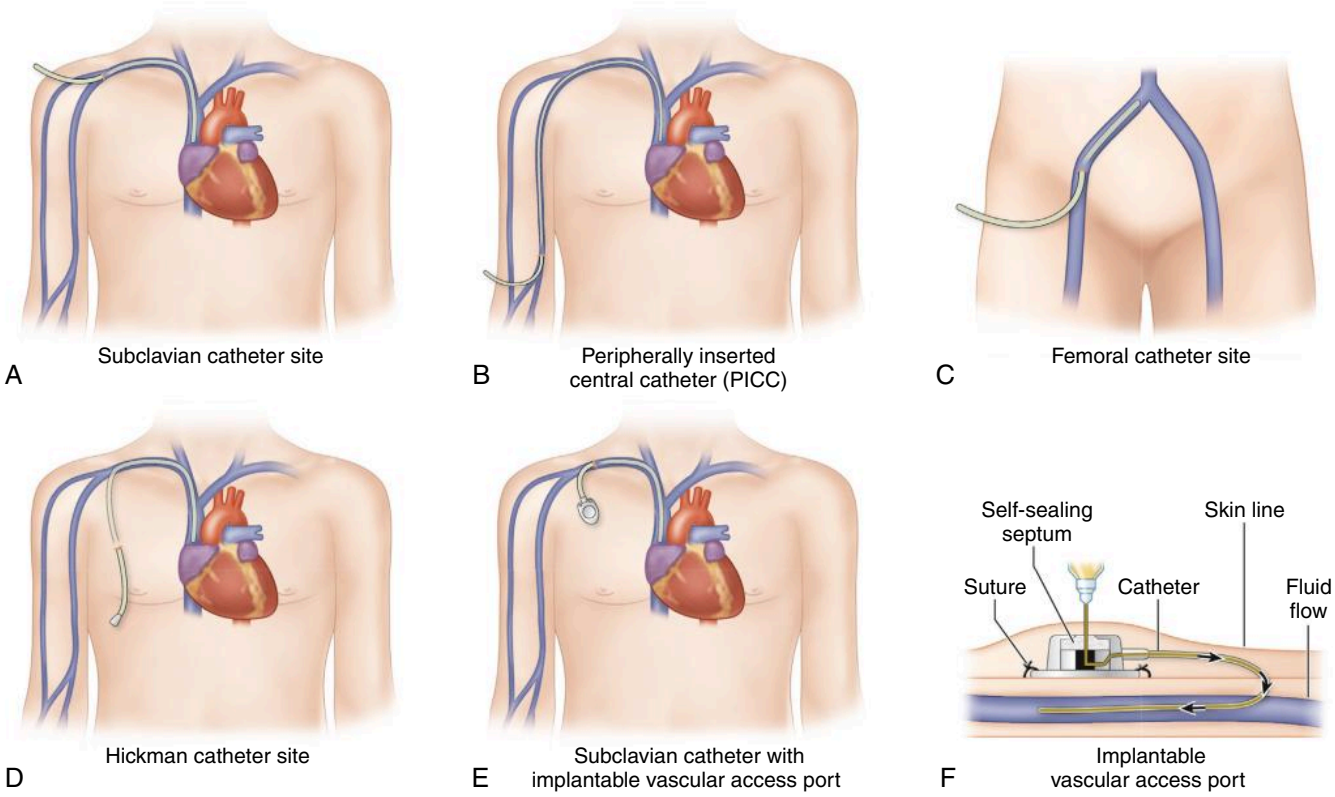

FIG. 70.5 Central venous access sites. **A,** Subclavian catheter. **B,** Peripherally inserted central catheter (PICC). **C,** Femoral catheter. **D,** Hickman catheter. **E,** Subclavian catheter with implantable vascular access port. **F,** Implantable vascular access port.

e. With multilumen catheters, more than one medication can be administered at the same time without incompatibility problems, and only one insertion site is present.

For central line insertion, tubing change, and line removal, place the client in the Trendelenburg's position if not contraindicated or in the supine position, and instruct the client to perform the Valsalva maneuver to increase pressure in the central veins when the IV system is open.

2. Tunneled central venous catheters
   - **a.** A more permanent type of catheter, such as the Hickman, Broviac, or Groshong catheter, is used for long-term IV therapy.
   - **b.** The catheter may be single-lumen or multilumen.
   - **c.** The catheter is inserted in the operating room, and the catheter is threaded into the lower part of the vena cava at the entrance of the right atrium (entrance site) and tunneled under the skin to the exit site where the catheter comes out of the chest; the catheter at the exit site is secured by means of a "cuff" just under the skin at the exit site.
   - **d.** The catheter is fitted with an intermittent infusion device to allow access as needed and to keep the system closed and intact.
   - **e.** Patency is maintained by flushing with a diluted heparin solution or normal saline solution, depending on the type of catheter, per agency policy.
3. Vascular access ports (implantable port)
   - **a.** Surgically implanted under the skin, ports such as a Port-a-Cath, Mediport, or Infusaport are used for long-term administration of repeated IV therapy.
   - **b.** For access, the port requires palpation and injection through the skin into the self-sealing port with a noncoring needle, such as a Huber point needle.
   - **c.** Patency is maintained by periodic flushing with a diluted heparin solution as prescribed and as per agency policy.
4. Peripherally inserted central catheter (PICC) line
   - **a.** The catheter is used for long-term IV therapy, frequently in the home.
   - **b.** The basilic vein usually is used, but the median cubital and cephalic veins in the antecubital area also can be used.
   - **c.** The catheter is threaded so that the catheter tip may terminate in the subclavian vein or superior vena cava.
   - **d.** A small amount of bleeding may occur at the time of insertion and may continue

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

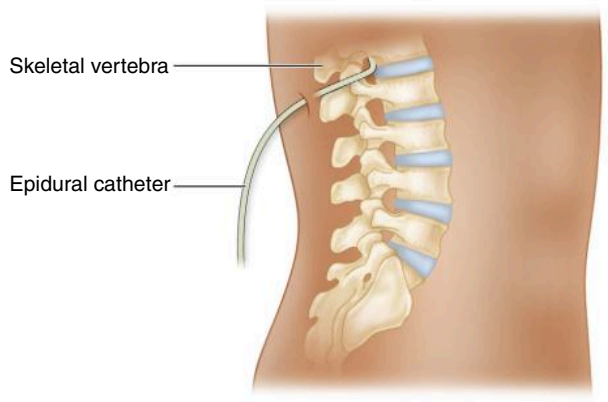

FIG. 70.6 Tunneled epidural catheter.

for 24 hours, but bleeding thereafter is not expected.

e. Phlebitis is a common complication.

R. Epidural catheter (Fig. 70.6)

1. Catheter is placed in the epidural space for the administration of analgesics; this method of administration reduces the amount of medication needed to control pain; therefore, the client experiences fewer side effects.

2. Assess client's vital signs, level of consciousness, and motor and sensory function of the lower extremities.

3. Monitor insertion site for signs of infection, and be sure that the catheter is secured to the client's skin and that all connections are taped to prevent disconnection.

4. Check PHCP's prescription regarding solution and medication administration.

5. For continuous infusion, monitor the electronic infusion device for proper rate of flow.

6. For bolus dose administration, follow the procedure for administering bolus doses through the catheter and follow agency procedure.

7. Aspiration is done before injecting medication; if more than 1 mL of clear fluid or blood returns, the medication is not injected and the PHCP or anesthesiologist is notified immediately (catheter may have migrated into the subarachnoid space or a blood vessel).

Contraindications to an epidural catheter and administration of epidural analgesia include skeletal and spinal abnormalities, bleeding disorders, use of anticoagulants, history of multiple abscesses, and sepsis.

II. Administration of Parenteral Nutrition

A. Parenteral nutrition (PN)

1. Description

a. Parenteral nutrition supplies nutrients via the veins.

b. PN consists of both **partial parenteral nutrition (PPN)** and **total parenteral nutrition (TPN).** The indication of the type used depends on the client's nutritional needs.

c. PN supplies carbohydrates in the form of dextrose, fats in an emulsified form, proteins in the form of amino acids, vitamins, minerals, electrolytes, and water.

d. PN prevents subcutaneous fat and muscle protein from being catabolized by the body for energy.

e. PN solutions are hypertonic due to the higher concentrations of glucose and addition of amino acids.

2. Indications

a. Clients with severely dysfunctional or nonfunctional gastrointestinal tracts who are unable to process nutrients may benefit from PN.

b. Clients who can take some oral nutrition but not enough to meet their nutrient requirements may benefit from PN.

c. Clients with multiple gastrointestinal surgeries, gastrointestinal trauma, severe intolerance to enteral feedings, or intestinal obstructions, or who need to rest the bowel for healing, may benefit from PN.

d. Clients with severe nutritionally deficient conditions such as acquired immunodeficiency syndrome, cancer, burn injuries, or **malnutrition**, or clients receiving chemotherapy, may benefit from PN.

PN is a form of nutrition and is used when there is no other nutritional alternative. Administering nutrition orally or through a nasogastric tube is usually initiated first, before PN is initiated.

3. Lines used for administration of PN (Fig. 70.7)

4. PPN

a. Usually administered through a large distal vein in the arm with a standard peripheral IV catheter or midline or through a PICC. A midline is placed in an upper arm vein such as the brachial or cephalic vein with the tip ending below the level of the axillary line.

b. If a PICC cannot be established, the subclavian vein or internal or external jugular veins can be used for PPN.

5. TPN

a. Administered through a central vein; the use of a PICC is acceptable. Other sites that can be used include the subclavian vein and the internal or external jugular veins.

b. If the bag of intravenous solution (the TPN) is empty and the nurse is waiting for the

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

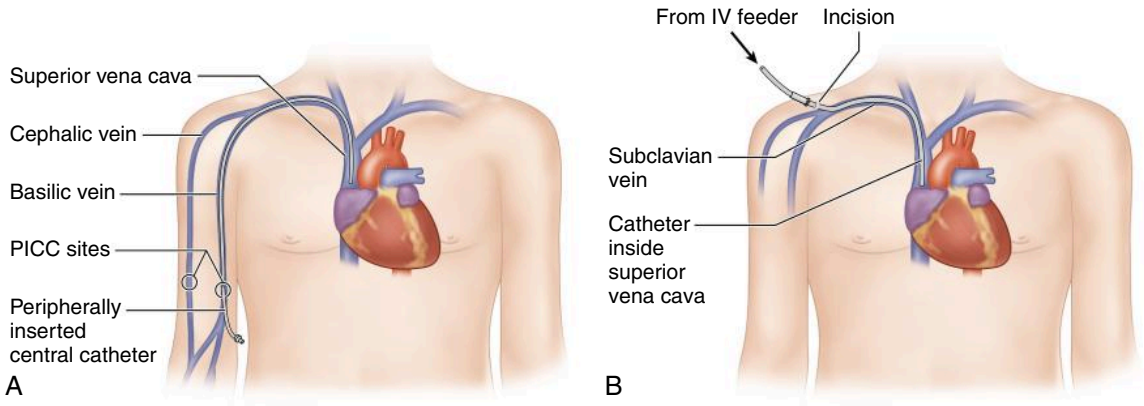

FIG. 70.7 **A,** Placement of peripherally inserted central catheter through antecubital fossa. **B,** Placement of central venous catheter inserted into subclavian vein. *IV,* Intravenous; *PICC,* peripherally inserted central catheter.

delivery of a new bag of solution from the pharmacy, a 10% dextrose in water solution should be infused at the prescribed rate to prevent hypoglycemia; the prescribed solution should be obtained as soon as possible.

⚠ The delivery of hypertonic solutions into peripheral veins can cause sclerosis, phlebitis, or swelling. Monitor closely for these complications.

6. Components of parenteral nutrition
   - **a.** Carbohydrates: The strength of the dextrose solution depends on the client's nutritional needs, the route of administration (central or peripheral), and agency protocols; carbohydrates typically provide 60% to 70% of calorie (energy) needs.
   - **b.** Amino acids (protein): Concentrations range from 3.5% to 20%. Lower concentrations are most commonly used for peripheral vein administration, and higher concentrations are most often administered through a central vein; about 15% to 20% of total energy needs should come from protein.
7. Fat emulsion (lipids)
   - **a.** Lipids provide up to 30% of calorie (energy) needs.
   - **b.** Lipids provide nonprotein calories and prevent or correct fatty acid deficiency.
   - **c.** Lipid solutions are isotonic and therefore can be administered through a peripheral or central vein; the solution may be administered through a separate IV line below the filter of the main IV administration set by a Y-connector, or as an admixture to the PN solution (3-in-1 admixture consisting of dextrose, amino acids, and lipids).
   - **d.** Most fat emulsions are prepared from soybean or safflower oil, with egg yolk to provide emulsification; the primary components are linoleic, oleic, palmitic, linolenic, and stearic acids (assess the client for allergies).
   - **e.** Glucose-intolerant clients or clients with diabetes mellitus may benefit from receiving a larger percentage of their PN from lipids, which helps to control blood glucose levels and to lower insulin requirements caused by infused dextrose.
   - **f.** Examine the bottle for separation of emulsion into layers or fat globules or for the accumulation of froth; if observed, do not use and return the solution to the pharmacy.
   - **g.** Additives should not be put into the fat emulsion solution.
   - **h.** Follow agency policy regarding the filter size that should be used; usually a 1.2-µm filter or larger should be used, because the lipid particles are too large to pass through a 0.22-µm filter.
   - **i.** Infuse solution at the flow rate prescribed—usually slowly at 1 mL/minute initially. Monitor vital signs every 10 minutes, and observe for adverse reactions for the first 30 minutes of the infusion. If signs of an adverse reaction occur, stop the infusion and notify the PHCP (Box 70.4).
   - **j.** If no adverse reaction occurs, adjust the flow rate to the prescribed rate.
   - **k.** Monitor serum lipids 4 hours after discontinuing the infusion.

⚠ Fat emulsions (lipids) contain egg yolk phospholipids and should not be given to clients with egg allergies.

8. Other components
   - **a.** PN solutions usually contain a standard multivitamin preparation to meet most vitamin needs and prevent deficiencies.
   - **b.** Individual vitamin preparations can be added, as needed and as prescribed.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.4 Signs and Symptoms of an Adverse Reaction to Lipids

- Chest and back pain
- Chills
- Cyanosis
- Diaphoresis
- Dyspnea
- Fever
- Flushing
- Headache
- Nausea and vomiting
- Pressure over the eyes
- Thrombophlebitis
- Vertigo

c. Minerals and trace elements: Commercial mineral and trace element preparations are available in various concentrations to promote normal metabolism.

d. Electrolytes: Electrolyte requirements for individuals receiving PN therapy vary, depending on body weight, presence of malnutrition or catabolism, degree of electrolyte depletion, changes in organ function, ongoing electrolyte losses, and the disease process.

e. Water: The amount of water needed in a PN solution is determined by electrolyte balance and fluid requirements.

f. Regular insulin: May be added to control the blood glucose level because of the high concentration of glucose in the PN solution

g. Heparin: May be added to reduce the buildup of a fibrinous clot at the catheter tip

B. Administration and discontinuation

1. Continuous PN

a. Infused continuously over 24 hours

b. Most commonly used in a hospital setting

2. Intermittent or cyclic PN

a. In general, the nutrient solution infusion regimen varies and is commonly administered overnight.

b. Allows clients requiring PN on a long-term basis to participate in activities of daily living during the day without the inconvenience of an IV bag and pump set

c. Monitor glucose levels closely because of the risk of hypoglycemia due to lack of glucose during noninfusion times.

3. Discontinuing PN therapy

a. Evaluation of nutritional status by a nutritionist is done before PN is discontinued.

b. If discontinuation is prescribed, gradually decrease the flow rate for 1 to 2 hours while increasing oral intake (this assists in preventing hypoglycemia).

c. After removal of the IV catheter, change the dressing daily until the insertion site heals. Note that central lines should not be left in without a reason due to risk of infection, but in some situations are left in place and used for another necessary reason (venous access, medication administration).

d. Encourage oral nutrition.

e. Record oral intake, body weight, and laboratory results of serum electrolyte and glucose levels.

⚠ Abrupt discontinuation of a PN solution can result in hypoglycemia. The flow rate should be decreased gradually when the PN is discontinued.

C. Complications (Table 70.3)

1. Pneumothorax and air embolism are associated with central line placement; air embolism is also associated with tubing changes.

2. Other complications include infection (catheter-related), hypervolemia, and metabolic alterations such as hyperglycemia and hypoglycemia; these complications are usually caused by the PN solution itself (see Clinical Judgment: Take Action box).

CLINICAL JUDGMENT: TAKE ACTION

The nurse is changing a client's central venous catheter dressing. After removal of the dressing, the nurse notes redness at the insertion site and some white drainage. The nurse takes the following actions in the care of the client:

- Checks vital signs
- Checks the most recent white blood cell count
- Notifies the primary health care provider
- Prepares to remove the catheter and for possible restart at a different location
- Cuts the tip of the catheter off after removal and sends it to the laboratory for culture
- Prepares the client for obtaining blood cultures
- Prepares for antibiotic administration
- Documents the occurrence, the actions taken, and the client's response

D. Additional nursing considerations

1. Check the PN solution with the PHCP's prescription to ensure that the prescribed components are contained in the solution; some health care agencies require validation of the prescription by two registered nurses.

2. To prevent infection and solution incompatibility, IV medications and blood are not given through the PN line.

3. Blood for testing may be drawn from the central venous access site; a port other than the port used to infuse the PN is used for blood draws after the PN has been stopped for several minutes (per agency procedure), because the PN solution can alter the results of the sample. The

TABLE 70.3 Complications of Parenteral Nutrition

Complication	Possible Cause	Signs or Symptoms	Interventions	Prevention
Air embolism	▪ Catheter system opened or IV tubing disconnected ▪ Air entry on IV tubing changes	▪ Apprehension ▪ Chest pain ▪ Dyspnea ▪ Hypotension ▪ Loud churning sound heard over pericardium on auscultation ▪ Rapid and weak pulse ▪ Respiratory distress	▪ Clamp all ports of the IV catheter. ▪ Place the client in a left side-lying position with the head lower than the feet. ▪ Notify the PHCP. ▪ Administer oxygen.	▪ Make sure all catheter connections are secure (use tape per agency protocol). ▪ Clamp the catheter when not in use and when changing caps (follow agency protocol for flushing and clamping the catheter and cap changes). ▪ Instruct the client in the Valsalva maneuver for tubing and cap changes. ▪ For tubing and cap changes, place the client in the Trendelenburg's position (if not contraindicated) with the head turned in the opposite direction of the insertion site; client should hold breath and bear down.
Hyperglycemia	▪ High concentration of dextrose in solution ▪ Client receiving solution too quickly ▪ Not enough insulin ▪ Infection	▪ Restlessness ▪ Confusion ▪ Weakness ▪ Diaphoresis ▪ Elevated blood glucose level >200 mg/dL (11.1 mmol/L) ▪ Excessive thirst ▪ Fatigue ▪ Kussmaul's respirations ▪ Coma (when severe)	▪ Notify the PHCP. ▪ The infusion rate may need to be slowed. ▪ Monitor blood glucose levels. ▪ Administer regular insulin as prescribed.	▪ Assess the client for a history of glucose intolerance. ▪ Assess the client's medication history (corticosteroids increase blood glucose). ▪ Begin infusion at a slow rate as prescribed (usually 40-60 mL/hr). ▪ Monitor blood glucose levels per agency protocol. ▪ Administer regular insulin as prescribed. ▪ Use strict aseptic technique to prevent infection.
Hypervolemia	▪ Excessive fluid administration or administration of fluid too rapidly ▪ Renal dysfunction ▪ Heart failure ▪ Hepatic failure	▪ Bounding pulse ▪ Crackles on lung auscultation ▪ Headache ▪ Increased blood pressure ▪ Jugular vein distention ▪ Weight gain greater than desired	▪ Slow or stop IV infusion. ▪ Notify the PHCP. ▪ Restrict fluids. ▪ Administer diuretics as prescribed. ▪ Use dialysis as prescribed (in extreme cases).	▪ Assess client's history for risk for hypervolemia. ▪ Administer via an electronic infusion device, and ensure proper function of the device. ▪ Never increase the rate of infusion of the device to "catch up" if the infusion gets behind. ▪ Monitor intake and output. ▪ Monitor weight daily (ideal weight gain is 1-2 lb per week).
Hypoglycemia	▪ PN abruptly discontinued ▪ Too much insulin being administered	▪ Anxiety ▪ Diaphoresis ▪ Hunger ▪ Low blood glucose level <70 mg/dL (<3.9 mmol/L) ▪ Shakiness ▪ Weakness	▪ Notify the PHCP. ▪ Administer IV dextrose. ▪ Monitor blood glucose level.	▪ Gradually decrease PN solution when discontinued. ▪ Infuse 10% dextrose at same rate as the PN to prevent hypoglycemia for 1-2 hours after the PN solution is discontinued. ▪ Monitor glucose levels, and check the level 1 hour after discontinuing the PN.
Infection	▪ Poor aseptic technique ▪ Catheter contamination ▪ Contamination of solution	▪ Chills ▪ Fever ▪ Elevated white blood cell count ▪ Redness or drainage at insertion site	▪ Notify the PHCP. ▪ Remove catheter. ▪ Send catheter tip to the laboratory for culture. ▪ Prepare to obtain blood cultures. ▪ Prepare for antibiotic administration.	▪ Use strict aseptic techniques (PN solution has a high concentration of glucose and is a medium for bacterial growth). ▪ Monitor temperature (fever could indicate infection). ▪ Assess IV site for signs of infection (redness, swelling, drainage). ▪ Change site dressing, solution, and tubing as specified by agency policy. ▪ Do not disconnect tubing unnecessarily.

TABLE 70.3 Complications of Parenteral Nutrition—cont'd

Complication	Possible Cause	Signs or Symptoms	Interventions	Prevention
Pneumothorax	▪ Inexact catheter placement resulting in puncture of the pleural space	▪ Chest or shoulder pain ▪ Sudden shortness of breath ▪ Cyanosis ▪ Tachycardia ▪ Absence of breath sounds on affected side	▪ Notify the PHCP. ▪ Prepare to obtain a chest x-ray. ▪ Small pneumothorax may resolve. ▪ Larger pneumothorax may require chest tube.	▪ Monitor for signs of pneumothorax. ▪ Obtain a chest x-ray after insertion of the catheter to ensure proper catheter placement. ▪ PN is not initiated until correct catheter placement is verified and the absence of pneumothorax is confirmed.

IV, Intravenous; *PHCP*, primary health care provider; *PN*, parenteral nutrition.
Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1007.

client with a central venous access site receiving PN should still have a venipuncture site.

4. Monitor partial thromboplastin time and prothrombin time for clients receiving anticoagulants.
5. Monitor electrolyte and albumin levels and liver and renal function studies, as well as any other prescribed laboratory studies. Blood studies for blood chemistries are normally done every other day or 3 times per week (per agency procedures) when the client is receiving PN; the results are the basis for the PHCP continuing or changing the PN solution or rate.
6. Monitor blood glucose levels as prescribed (usually every 4 hours) because of the risk for hyperglycemia from the PN solution components.
7. In severely dehydrated clients, the albumin level may drop initially after initiating PN because the treatment restores hydration.
8. With severely malnourished clients, monitor for "refeeding syndrome" (a rapid drop in **potassium, magnesium**, and phosphate serum levels).
9. The electrolyte shift that occurs in "refeeding syndrome" can cause cardiovascular, respiratory, and neurological problems; monitor for shallow respirations, confusion, weakness, bleeding tendencies, and seizures. If noted, the PHCP is notified immediately.
10. Abnormal liver function values may indicate intolerance to or an excess of fat emulsion or problems with metabolism with glucose and protein.
11. Abnormal renal function tests may indicate an excess of amino acids.
12. PN solutions should be stored under refrigeration and administered within 24 hours from the time they are prepared (remove from refrigerator 0.5 to 1 hour before use).
13. PN solutions that are cloudy or darkened should not be used and should be returned to the pharmacy.
14. Additions of substances such as nutrients to PN solutions should be made in the pharmacy and not on the nursing unit.
15. Consultation with the nutritionist should be done on a regular basis (as prescribed or per agency protocol).

BOX 70.5 Home Care Instructions for Parenteral Nutrition Therapy

- Teach the client and caregiver how to obtain, administer, and maintain parenteral nutrition fluids.
- Teach the client and caregiver how to change a sterile dressing.
- Obtain a daily weight at the same time of day in the same clothes.
- Stress that if a weight gain of more than 3 lb/week is noted, this may indicate excessive fluid intake and should be reported.
- Monitor the blood glucose level, and report abnormalities immediately. Teach the client how to monitor for and manage hypoglycemia and hyperglycemia.
- Teach the client and caregiver about the signs and symptoms of side effects or adverse effects, such as infection, thrombosis, air embolism, and catheter displacement.
- Teach the client and caregiver the actions to take if a complication arises and about the importance of reporting complications to the primary health care provider.
- For signs and symptoms of thrombosis, the client should report edema of the arm or at the catheter insertion site, neck pain, and jugular vein distention.
- Leaking of fluid from the insertion site or pain or discomfort as the fluids are infused may indicate displacement of the catheter; this must be reported immediately.
- Encourage the client and caregiver to contact the primary health care provider if they have questions about administration or any other questions.
- Inform the client and caregiver about the importance of follow-up care.
- Teach the client to keep electronic infusion devices fully charged in case of electrical power failure.

E. Home care instructions (Box 70.5)

III. Administration of Blood Products

A. Blood products

1. Packed red blood cells (PRBCs)

a. PBRCs are a blood product used to replace erythrocytes; infusion time for 1 unit is usually between 2 and 4 hours.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

b. Each unit increases the hemoglobin level by 1 g/dL (10 g/L) and hematocrit by 3% (0.03); the change in laboratory values takes at least 1 hour after completion of the blood transfusion.

c. Evaluation of an effective response is based on the resolution of the symptoms of anemia and an increase in the erythrocyte, hemoglobin, and hematocrit count. Laboratory results are checked after transfusion following agency policy.

d. Leukocyte-poor or leukocyte-depleted units are units in which leukocytes, proteins, and plasma have been reduced. They are used to restore oxygen-carrying capacity of blood and intravascular volume.

Washed red blood cells (depleted of plasma, platelets, and leukocytes) may be prescribed for a client with a history of allergic transfusion reactions or those who underwent hematopoietic stem cell transplant. Leukocyte depletion (leukoreduction) by filtration, washing, or freezing is the process used to decrease the amount of white blood cells (WBCs) in a unit of packed cells.

2. Platelet transfusion

a. Platelets are used to treat thrombocytopenia and platelet dysfunctions.

b. Clients receiving multiple units of platelets can become "alloimmunized" to different platelet antigens. These clients may benefit from receiving only platelets that match their specific human leukocyte antigen (HLA).

c. Crossmatching is not required but usually is done (platelet concentrates contain few red blood cells [RBCs]).

d. The volume in a unit of platelets may vary; always check the bag for the volume of the blood component (in milliliters).

e. Platelets are administered immediately upon receipt from the blood bank and are given rapidly, usually over 15 to 30 minutes.

f. Evaluation of an effective response is based on improvement in the platelet count, and platelet counts normally are evaluated 1 hour and 18 to 24 hours after the transfusion; for each unit of platelets administered, an increase of 5000 to 10,000 mm^3 (5 to 10 × 10^9/L) is expected.

3. Fresh-frozen plasma

a. Fresh-frozen plasma may be used to provide clotting factors or volume expansion; it contains no platelets.

b. Fresh-frozen plasma is infused within 2 hours of thawing, while clotting factors are still viable, and is infused over a period of 15 to 30 minutes.

c. Rh compatibility and ABO compatibility are required for the transfusion of plasma products.

d. Evaluation of an effective response is assessed by monitoring coagulation studies, particularly the prothrombin time and the partial thromboplastin time, and resolution of hypovolemia.

4. Cryoprecipitates

a. Prepared from fresh-frozen plasma, cryoprecipitates can be stored for 1 year. Once thawed, the product must be used; 1 unit is administered over 15 to 30 minutes.

b. Used to replace clotting factors, especially factor VIII and fibrinogen

c. Evaluation of an effective response is assessed by monitoring coagulation studies and fibrinogen levels.

5. Granulocytes

a. May be used to treat a client with sepsis or a neutropenic client with an infection that is unresponsive to antibiotics

b. Evaluation of an effective response is assessed by monitoring the WBC and differential counts.

Document the necessary information about the blood transfusion in the client's medical record (follow agency guidelines). Include the client's tolerance and response to the transfusion and the effectiveness of the transfusion.

B. Types of blood donations

1. Autologous

a. A donation of the client's own blood before a scheduled procedure is an autologous donation; it reduces the risk of disease transmission and potential transfusion complications.

b. Autologous donation is not an option for a client with leukemia or bacteremia.

c. A donation can be made every 3 days as long as the hemoglobin remains within a safe range.

d. Donations should begin within 5 weeks of the transfusion date and end at least 3 days before the date of transfusion.

2. Blood salvage

a. Blood salvage is an autologous donation that involves suctioning blood from body cavities, joint spaces, or other closed body sites.

b. Blood may need to be "washed," a special process that removes tissue debris before reinfusion.

3. Designated donor

a. Designated donation occurs when recipients select their own compatible donors.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.4 Compatibility Chart for Red Blood Cell Transfusions

	Recipient			
Donor	**A**	**B**	**AB**	**O**
A	X		X	
B		X	X	
AB			X	
O	X	X	X	X

The ABO type of the donor should be compatible with the recipient's. Type A can receive from type A or O; type B from type B or O; type AB can receive from type A, B, AB, or O; type O only from type O.

From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 506.

b. Donation does not reduce the risk of contracting infections transmitted by the blood; however, recipients feel more comfortable identifying their donors.

C. Compatibility (Table 70.4)

1. Client (the recipient) blood samples are drawn and labeled at the client's bedside at the time the blood samples are drawn; the client is asked to state their name, which is compared with the name on the client's identification band or bracelet.

2. The recipient's ABO type and **Rh** type are identified.

3. An antibody screen is done to determine the presence of antibodies other than anti-A and anti-B.

4. To determine compatibility, crossmatching is done, in which donor red blood cells are combined with the recipient's **serum** and Coombs' serum; the crossmatch is compatible if no RBC agglutination occurs.

5. The universal RBC donor is O negative; the universal recipient is AB positive.

6. Clients with Rh-positive blood can receive RBC transfusion from an Rh-negative donor if necessary; however, an Rh-negative client should not receive Rh-positive blood.

⚠ The donor's blood and the recipient's blood must be tested for compatibility. If the blood is not compatible, a life-threatening transfusion reaction can occur.

D. Infusion pumps

1. Infusion pumps may be used to administer blood products if they are designed to function with opaque solutions; special IV tubing with a filter is used specifically for blood products to prevent hemolysis of red blood cells.

2. Always consult manufacturer guidelines for how to use the pump and compatibility for use with blood transfusions.

3. Special manual pressure cuffs designed specifically for blood product administration may be used to increase the flow rate, but the pressure should not exceed 300 mm Hg.

4. Standard sphygmomanometer cuffs are not to be used to increase the flow rate because they do not exert uniform pressure against all parts of the bag.

E. Blood warmers

1. Blood warmers may be used to prevent hypothermia and adverse reactions when several units of blood are being administered.

2. Special warmers have been designed for this purpose, and only devices specifically approved for this use can be used.

⚠ If blood warming is necessary, use only warming devices specifically designed and approved for warming blood products. Do not warm blood products in a microwave oven or in hot water.

F. Precautions and nursing responsibilities (Box 70.6)

⚠ Check the client's identity (two identifiers) with another licensed nurse before administering a blood product. Be sure to check the PHCP's prescription, that the client has an appropriate venous access site, that crossmatching procedures have been completed, that an informed consent has been obtained, and that the correct client is receiving the correct type of blood. Use barcode scanning systems per agency policy to ensure client safety.

G. **Transfusion reactions** (Box 70.7)

1. Description

a. A transfusion reaction is an adverse reaction that happens as a result of receiving a blood transfusion.

b. Types of transfusion reactions include hemolytic, allergic, febrile or bacterial reactions (**septicemia**), or transfusion-associated graft-versus-host disease (GVHD).

2. Signs of an immediate transfusion reaction

a. Chills and diaphoresis

b. Muscle aches, back pain, or chest pain

c. Rashes, hives, itching, and swelling

d. Rapid, thready pulse

e. Dyspnea, cough, or wheezing

f. Pallor and cyanosis

g. Apprehension

h. Tingling and numbness

i. Headache

j. Nausea, vomiting, abdominal cramping, and diarrhea

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.6 Precautions and Nursing Responsibilities for Blood Administration

General Precautions

- A large volume of refrigerated blood infused rapidly through a central venous catheter into the ventricle of the heart can cause cardiac dysrhythmias.
- No solution other than normal saline should be added to blood components.
- Medications are never added to blood components or piggybacked into a blood transfusion.
- To avoid the risk of septicemia, infusions (1 unit) should not exceed the prescribed time for administration (2 to 4 hours for packed red blood cells); follow evidence-based practice guidelines and agency procedure.
- The blood administration set should be changed with each unit of blood, or according to agency policy, to reduce the risk of septicemia.
- Check the blood bag for the date of expiration; components expire at midnight on the day marked on the bag unless otherwise specified.
- Inspect the blood bag for leaks, abnormal color, clots, and bubbles.
- Blood must be administered as soon as possible (within 20 to 30 minutes) after being received from the blood bank, because this is the maximal allowable time out of monitored storage.
- Never refrigerate blood in refrigerators other than those used in blood banks; if the blood is not administered within 20 to 30 minutes, return it to the blood bank.
- The recommended rate of infusion varies with the blood component being transfused and depends on the client's condition; generally, blood is infused as quickly as the client's condition allows (always follow agency guidelines and prescriptions).
- Components containing few red blood cells (RBCs) and platelets may be infused rapidly, but caution should be taken to avoid circulatory overload.
- The nurse should measure vital signs and assess lung sounds before the transfusion and again after the first 15 minutes and every 30 minutes to 1 hour (per agency policy) until 1 hour after the transfusion is completed.

Client Assessment

- Assess for any cultural or religious beliefs regarding blood transfusions.
- A Jehovah's Witness cannot receive blood or blood products; this group believes that receiving a blood transfusion has eternal consequences.
- Ensure that an informed consent has been obtained.
- Explain the procedure to the client and determine whether the client has ever received a blood transfusion or experienced any previous reactions to blood transfusions.
- Check the client's vital signs; assess renal, circulatory, and respiratory status and the client's ability to tolerate intravenously administered fluids.
- If the client's temperature is elevated, notify the PHCP before beginning the transfusion; a fever may be a cause for delaying the transfusion in addition to masking a possible symptom of an acute transfusion reaction.

Blood Bank Precautions

- Blood will be released from the blood bank only to personnel specified by agency policy.
- The name and identification number of the intended recipient must be provided to the blood bank, and a documented permanent record of this information must be maintained.
- Blood should be transported from the blood bank to only one client at a time to prevent blood delivery to the wrong client.
- Only 1 unit of blood should be transported at a time, even if the client is prescribed to have more than 1 unit transfused.

Client Identity and Compatibility

- Check the PHCP's prescription for the administration of the blood product.
- The most critical phase of the transfusion is confirming product compatibility and verifying client identity.
- Universal barcode systems for blood transfusions should be used to confirm product compatibility, client identity, and expiration (client identification requires two identifiers).
- Two licensed nurses (follow agency procedure) need to check the PHCP's prescription, the client's identity, and the client's identification band or bracelet and number, verifying that the name and number are identical to those on the blood component tag.
- At the bedside, the nurse asks the client to state their name, and the nurse compares the name with the name on the identification band or bracelet.
- The nurse checks the blood bag tag, label, and blood requisition form to ensure that ABO and Rh types are compatible. The nurse uses the barcode scanning system per agency policy.
- If the nurse notes any inconsistencies when verifying client identity and compatibility, the nurse notifies the blood bank immediately.

Administration of the Transfusion

- Maintain standard and transmission-based precautions and surgical asepsis as necessary.
- Insert an intravenous (IV) line and infuse normal saline; maintain the infusion at a keep-vein-open rate.
- An 18- or 19-gauge IV needle will be needed to achieve a maximum flow rate of blood products and to prevent damage to RBCs; if a smaller-gauge needle must be used, RBCs may be diluted with normal saline (check agency procedure).
- A central venous catheter is an acceptable venous access option for blood transfusions; for a multilumen catheter, use the largest catheter port available or check the port size to ensure that it is adequate for blood administration.
- Always check the bag for the volume of the blood component.
- Blood products should be infused through administration sets designed specifically for blood; use a Y-tubing or straight-tubing blood administration set that contains a filter designed to trap fibrin clots and other debris that accumulate during blood storage.
- Premedicate the client with acetaminophen or diphenhydramine, as prescribed, if the client has a history of adverse reactions; if prescribed, oral medications should be administered 30 minutes before the transfusion is started, and intravenously administered medications may be given immediately before the transfusion is started.
- Instruct the client to report anything unusual immediately.
- Determine the rate of infusion by the PHCP's prescription or, if not specified, by agency policy.

Telegram & Insta: NCLEX_RN_Edu

BOX 70.6 Precautions and Nursing Responsibilities for Blood Administration—cont'd

- Begin the transfusion slowly under close supervision; if no reaction is noted within the first 15 minutes, the flow can be increased to the prescribed rate.
- During the transfusion, monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client.
- If an ABO incompatibility exists or a severe allergic reaction occurs, the reaction is usually evident within the first 50 mL of the transfusion.
- Document the client's tolerance to the administration of the blood product.
- Monitor appropriate laboratory values and document effectiveness of treatment related to the specific type of blood product.

Reactions to the Transfusion

- If a transfusion reaction occurs, stop the transfusion, change the IV tubing down to the IV site, keep the IV line open with normal saline, notify the PHCP and blood bank, and return the blood bag and tubing to the blood bank.
- Do not leave the client alone; monitor the client's vital signs and monitor for any life-threatening signs or symptoms.
- Obtain appropriate laboratory samples, such as blood and urine samples (free hemoglobin indicates that RBCs were hemolyzed), according to agency procedures.

BOX 70.7 Complications of a Blood Transfusion

- Transfusion reactions
- Circulatory overload
- Septicemia
- Iron overload
- Disease transmission
- Hypocalcemia
- Hyperkalemia
- Citrate toxicity

3. Signs of a transfusion reaction in an unconscious client
   - **a.** Weak pulse
   - **b.** Fever
   - **c.** Tachycardia or bradycardia
   - **d.** Hypotension
   - **e.** Visible hemoglobinuria
   - **f.** Oliguria or anuria
4. Delayed transfusion reactions
   - **a.** Reactions can occur days to years after a transfusion.
   - **b.** Signs include fever, mild jaundice, and a decreased hematocrit level.

⚠ Stay with the client for the first 15 minutes of the infusion of blood and monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client. Vital signs are monitored every 30 minutes to 1 hour according to institutional protocol.

5. Interventions (see Clinical Judgment: Take Action box)

⚠ Stop the transfusion immediately if a blood transfusion reaction is suspected.

CLINICAL JUDGMENT: TAKE ACTION

A client receiving a unit of packed red blood cells suddenly complains of chills and a backache. The client also tells the nurse about feeling itchy, and the nurse notes a neck and chest rash. The nurse takes the following actions in the care of the client:

- Stops the transfusion
- Changes the intravenous (IV) tubing down to the IV site and keeps the IV line open with normal saline
- Checks vital signs
- Notifies the primary health care provider and blood bank
- Stays with the client, observing signs and symptoms and monitoring vital signs as often as every 5 minutes
- Prepares to administer emergency medications as prescribed and performs cardiopulmonary resuscitation if needed
- Obtains a urine specimen for laboratory studies and obtains specimens for any other laboratory studies as prescribed
- Returns blood bag, tubing, attached labels, and transfusion record to the blood bank
- Documents the occurrence, actions taken, and the client's response

H. **Circulatory overload**

1. Description: Caused by the infusion of blood at a rate too rapid for the client to tolerate
2. Assessment
   - **a.** Cough, dyspnea, chest pain, and wheezing on auscultation of the lungs
   - **b.** Headache
   - **c.** Hypertension
   - **d.** Tachycardia and a bounding pulse
   - **e.** Distended neck veins
3. Interventions
   - **a.** Slow the rate of infusion.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

b. Place the client in an upright position, with the feet in a dependent position.
c. Notify the PHCP.
d. Administer oxygen, diuretics, and morphine sulfate, as prescribed.
e. Monitor for dysrhythmias.
f. Phlebotomy also may be a method of prescribed treatment in a severe case.

I. Septicemia
1. Description: Occurs with the transfusion of blood that is contaminated with microorganisms
2. Assessment
a. Rapid onset of chills and a high fever
b. Vomiting
c. Diarrhea
d. Hypotension
e. Shock
3. Interventions
a. Notify the PHCP.
b. Obtain blood cultures and cultures of the blood bag.
c. Administer oxygen, IV fluids, antibiotics, vasopressors, and corticosteroids as prescribed.

J. Iron overload
1. Description: A delayed transfusion complication that occurs in clients who receive multiple blood transfusions, such as clients with anemia or thrombocytopenia
2. Assessment
a. Vomiting
b. Diarrhea
c. Hypotension
d. Altered hematological values
3. Interventions
a. Deferoxamine, administered intravenously or subcutaneously, removes accumulated iron via the kidneys.
b. Urine turns red as iron is excreted after the administration of deferoxamine; treatment is discontinued when serum iron levels return to normal.

Contact the PHCP immediately if a transfusion reaction or a complication of blood administration arises.

K. Disease transmission
1. The disease most commonly transmitted is hepatitis C, which is manifested by anorexia, nausea, vomiting, dark urine, and jaundice; the symptoms usually occur within 4 to 6 weeks after the transfusion.
2. Other infectious agents and diseases transmitted by blood transfusion include hepatitis B virus, human immunodeficiency virus (HIV), human herpes virus type 6, Epstein-Barr virus, human T-cell leukemia, cytomegalovirus, and malaria.
3. Donor screening has greatly reduced the risk of transmission of infectious agents; in addition, antibody testing of donors for HIV has greatly reduced the risk of transmission.

L. Hypocalcemia
1. Citrate in transfused blood binds with calcium and is excreted.
2. Assess serum calcium level before and after the transfusion.
3. Monitor for signs of hypocalcemia (hyperactive reflexes, paresthesias, tetany, muscle cramps, positive Trousseau's sign, positive Chvostek's sign).
4. Slow the transfusion and notify the PHCP if signs of hypocalcemia occur.

M. Hyperkalemia
1. Stored blood liberates potassium through hemolysis.
2. The older the blood, the greater the risk of hyperkalemia; therefore, clients at risk for hyperkalemia, such as those with renal insufficiency or renal failure, should receive fresh blood.
3. Assess the date on the blood and the serum potassium level before and after the transfusion.
4. Monitor the potassium level and for signs and symptoms of hyperkalemia (paresthesias, weakness, abdominal cramps, diarrhea, and dysrhythmias).
5. Slow the transfusion and notify the PHCP if signs of hyperkalemia occur.

N. Citrate toxicity
1. Citrate, the anticoagulant used in blood products, is metabolized by the liver.
2. Rapid administration of multiple units of stored blood may cause hypocalcemia and hypomagnesemia when citrate binds calcium and magnesium; this results in citrate toxicity, causing myocardial depression and coagulopathy.
3. Those most at risk include individuals with liver dysfunction or neonates with immature liver function.
4. Treatment includes slowing or stopping the transfusion to allow the citrate to be metabolized; hypocalcemia and hypomagnesemia are also treated with replacement therapy.

IV. Tube Care

A. Nasogastric (NG) tubes
1. These are tubes used to intubate the stomach.
2. The tube is inserted from the nose to the stomach.

B. Purpose
1. To decompress the stomach by removing fluids or gas to promote abdominal comfort
2. To allow surgical anastomoses to heal without distention
3. To decrease the risk of aspiration
4. To administer medications to clients who are unable to swallow

Telegram & Insta: NCLEX_RN_Edu

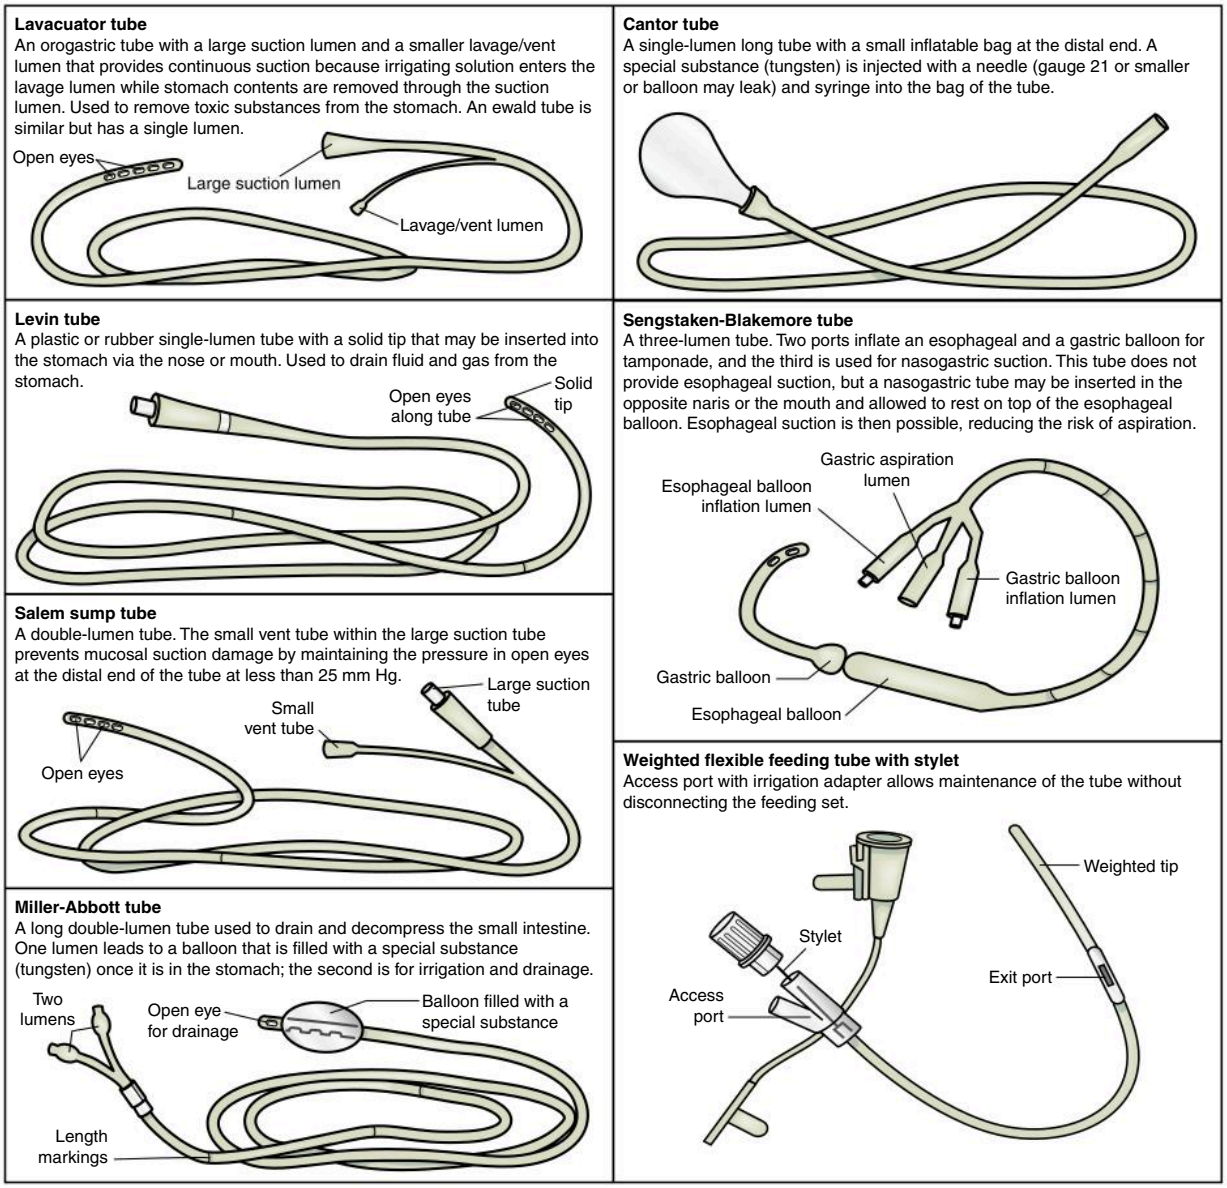
Telegram & Insta: NCLEX_RN_Edu

5. To provide nutrition by acting as a temporary feeding tube
6. To irrigate the stomach and remove toxic substances, such as in poisoning

C. Types of tubes
   1. Levin tube (Fig. 70.8)
      a. Single-lumen nasogastric tube
      b. Used to remove gastric contents via intermittent suction or to provide tube feedings
   2. Salem sump tube: A Salem sump is a double-lumen nasogastric tube with an air vent (pigtail) used for decompression with intermittent continuous suction (see Fig. 70.8).

⚠ The air vent on a Salem sump tube is not to be clamped and is to be kept above the level of the stomach. If leakage occurs through the air vent, instill 30 mL of air into the air vent and irrigate the main lumen with normal saline (NS).

D. Intubation procedures (Box 70.8)
E. Irrigation
   1. Assess placement before irrigating (see Box 70.8).
   2. Perform irrigation every 4 hours to assess and maintain the patency of the tube.
   3. Gently instill 30 to 50 mL of water or NS (depending on agency policy) with an irrigation syringe.
   4. Pull back on the syringe plunger to withdraw the fluid to check patency; repeat if the tube flow is sluggish.
F. Removal of a nasogastric tube: Ask the client to take a deep breath and hold it; remove the tube slowly and evenly over the course of 3 to 6 seconds (coil the tube around the hand while removing it).
G. Gastrointestinal tube feedings
   1. Types of tubes and anatomical placement
      a. Nasogastric: Nose to stomach



Lavacuator tube
An orogastric tube with a large suction lumen and a smaller lavage/vent lumen that provides continuous suction because irrigating solution enters the lavage lumen while stomach contents are removed through the suction lumen. Used to remove toxic substances from the stomach. An ewald tube is similar but has a single lumen.
Open eyes
Large suction lumen
Lavage/vent lumen
Cantor tube
A single-lumen long tube with a small inflatable bag at the distal end. A special substance (tungsten) is injected with a needle (gauge 21 or smaller or balloon may leak) and syringe into the bag of the tube.
Levin tube
A plastic or rubber single-lumen tube with a solid tip that may be inserted into the stomach via the nose or mouth. Used to drain fluid and gas from the stomach.
Open eyes along tube
Solid tip
Sengstaken-Blakemore tube
A three-lumen tube. Two ports inflate an esophageal and a gastric balloon for tamponade, and the third is used for nasogastric suction. This tube does not provide esophageal suction, but a nasogastric tube may be inserted in the opposite naris or the mouth and allowed to rest on top of the esophageal balloon. Esophageal suction is then possible, reducing the risk of aspiration.
Gastric aspiration lumen
Esophageal balloon inflation lumen
Gastric balloon inflation lumen
Gastric balloon
Esophageal balloon
Salem sump tube
A double-lumen tube. The small vent tube within the large suction tube prevents mucosal suction damage by maintaining the pressure in open eyes at the distal end of the tube at less than 25 mm Hg.
Large suction tube
Small vent tube
Open eyes
Weighted flexible feeding tube with stylet
Access port with irrigation adapter allows maintenance of the tube without disconnecting the feeding set.
Weighted tip
Stylet
Exit port
Access port
Miller-Abbott tube
A long double-lumen tube used to drain and decompress the small intestine. One lumen leads to a balloon that is filled with a special substance (tungsten) once it is in the stomach; the second is for irrigation and drainage.
Two lumens
Open eye for drainage
Balloon filled with a special substance
Length markings

FIG. 70.8 Comparison of design and function of selected gastrointestinal tubes.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.8 Nasogastric Tubes: Intubation Procedures

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Position the client in a high-Fowler's position with pillows behind the shoulders.
4. Determine which nostril is more patent.
5. Measure the length of the tube from the bridge of the nose to the earlobe to the xiphoid process and indicate this length with a piece of tape on the tube (remember the abbreviation NEX, which stands for nose, earlobe, and xiphoid process).
6. If the client is conscious and alert, have the client swallow or drink water (follow agency procedure).
7. Lubricate the tip of the tube with water-soluble lubricant.
8. Gently insert the tube into the nasopharynx and advance the tube.
9. When the tube nears the back of the throat (first black measurement on the tube), instruct the client to swallow or drink sips of water (unless contraindicated). If resistance is met, slowly rotate and aim the tube downward and toward the closer ear; in the intubated or semiconscious client, flex the head toward the chest while passing the tube.
10. Immediately withdraw the tube if any change is noted in the client's respiratory status.
11. Following insertion, obtain an abdominal x-ray study to confirm placement of the tube.
12. Connect the tube to suction, to either the intermittent or the continuous suction setting as prescribed, if the purpose of the tube is for decompression.
13. Secure the tube to the client's nose with adhesive tape and to the client's gown (follow agency procedure and check for client allergy to tape).
14. Observe the client for nausea, vomiting, abdominal fullness, or distention, and monitor gastric output.
15. Check residual volumes every 4 hours, before each feeding, and before giving medications. Aspirate all stomach contents (residual) and measure the amount. Reinstill residual contents to prevent excessive fluid and electrolyte losses, unless the residual contents appear abnormal or the volume is large (greater than 250 mL). Always follow agency procedure. Withhold a feeding if the residual amount is more than 100 mL or according to agency or nutritional consult recommendations.
16. Before the instillation of any substance through the tube (i.e., irrigation solution, feeding, medications), aspirate stomach contents and test the pH (a pH of 3.5 or lower indicates that the tip of the tube is in a gastric location).
17. If irrigation is indicated, use normal saline solution (check agency procedure).
18. Observe the client for fluid and electrolyte balance.
19. Instruct the client about movement to prevent nasal irritation and dislodgment of the tube.
20. On a daily basis, remove the adhesive tape that is securing the tube to the nose and clean and dry the skin, assessing for excoriation; then reapply the tape.

NOTE: Gastrostomy or jejunostomy tubes are surgically inserted. A dressing is placed at the site of insertion. The dressing needs to be removed, the skin needs to be cleansed (with a solution determined by the health care provider or agency procedure), and a new sterile dressing needs to be applied every 8 hours (or as specified by agency policy). The skin at the insertion site is checked for signs of excoriation, infection, or other abnormalities, such as leakage of the feeding solution.
Adapted from: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1224-1229.

   b. Nasoduodenal-nasojejunal: Nose to duodenum or jejunum
   c. Gastrostomy: Stomach
   d. Jejunostomy: Jejunum
2. Types of administration
   a. Bolus: A bolus resembles normal meal feeding patterns; formula is administrated over a 30- to 60-minute period every 3 to 6 hours; the amount of formula and frequency can be recommended by the dietitian and is prescribed by the PHCP.
   b. Continuous: Feeding is administered continually for 24 hours; an infusion feeding pump regulates the flow.
   c. Cyclical: Feeding is administered in the daytime or nighttime for approximately 8 to 16 hours (feedings at night allow for more freedom during the day).
   d. An infusion feeding pump regulates the flow.
3. Administration of feedings
   a. Check the PHCP's prescription and agency policy regarding residual amounts; usually, if the residual is less than 100 mL, feeding is administered; large-volume aspirates indicate delayed gastric emptying and place the client at risk for aspiration.
   b. Assess bowel sounds; hold the feeding and notify the PHCP if bowel sounds are absent.
   c. Position the client in a high-Fowler's position; if comatose, place in high-Fowler's and on the right side.
   d. Assess tube placement by aspirating gastric contents and measuring the pH (should be 3.5 or lower) or per agency procedure.
   e. Aspirate all stomach contents (residual), measure the amount, and return the contents to the stomach to prevent electrolyte imbalances (unless the color or characteristics of the residual are abnormal or the amount is greater than 250 mL).
   f. Warm the feeding to room temperature to prevent diarrhea and cramps.
   g. Use an infusion feeding pump for continuous or cyclic feedings.
   h. For bolus feeding, maintain the client in a high-Fowler's position for 30 minutes after

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

the feeding. Use an infusion pump or allow the feeding to infuse via gravity. Do not plunge the feeding into the stomach.

i. For a continuous feeding, keep the client in a semi-Fowler's position at all times.

4. Precautions

Always assess the placement of a gastrointestinal tube before instilling feeding solutions, medications, or any other solution. If the tube is incorrectly placed, the client is at risk for aspiration.

a. Change the feeding container and tubing every 24 hours or per agency policy.
b. Do not hang more solution than is required for a 4-hour period; this prevents bacterial growth.
c. Check the expiration date on the formula before administering.
d. Shake the formula well before pouring it into the container (feeding bag). Some feedings require the use of a bag in which formula is added, or require the use of bottles that feeding tubing can be attached to directly. The tubing sometimes has a Y-site connection so that a regular flush can be programmed using the pump rather than using a piston syringe.
e. Always assess bowel sounds; do not administer any feedings if bowel sounds are absent.
f. Administer the feeding at the prescribed rate or via gravity flow (intermittent bolus feedings) with a 50- to 60-mL syringe with the plunger removed.
g. Gently flush with 30 to 50 mL of water or NS (depending on agency policy) using the irrigation syringe after the feeding.

5. Complications of feedings include aspiration, diarrhea, vomiting, or a clogged tube.
6. Aspiration
   a. Verify tube placement.
   b. Do not administer the feeding if residual is more than 100 mL (check PHCP's prescription and agency policy).
   c. Keep the head of the bed elevated.
   d. If aspiration occurs, suction as needed, assess respiratory rate, auscultate lung sounds, monitor temperature for aspiration pneumonia, and prepare to obtain a chest radiograph.
7. Diarrhea
   a. Assess the client for lactose intolerance.
   b. Use fiber-containing feedings.
   c. Administer feeding slowly and at room temperature.
8. Vomiting
   a. Administer feedings slowly and, for bolus feedings, make feeding last for at least 30 minutes.
   b. Measure abdominal girth.
   c. Do not allow the feeding bag to empty.
   d. Do not allow air to enter the tubing.
   e. Administer the feeding at room temperature.
   f. Elevate the head of the bed.
   g. Administer antiemetics as prescribed.
9. Clogged tube
   a. Use liquid forms of medication, if possible.
   b. Flush the tube with 30 to 50 mL of water or NS (depending on agency policy) before and after medication administration and before and after bolus feeding.
   c. Flush with water every 4 hours for continuous feeding.

If the client vomits, stop the tube feeding and place the client in a side-lying position; suction the client as needed.

H. Administration of medications (Box 70.9)
I. Intestinal tubes
   1. Description
      a. The intestinal tube is passed nasally into the small intestine.
      b. It may be used to decompress the bowel or to remove accumulated intestinal secretions when other interventions to decompress the bowel are not effective.

BOX 70.9 Administering Medications via a Nasogastric, Gastrostomy, or Jejunostomy Tube

1. Check the PHCP's prescription.
2. Prepare the medication for administration.
3. Ensure that the medication prescribed can be crushed or is a capsule that can be opened; use elixir forms of medications if available.
4. Dissolve crushed medication or capsule contents in 15 to 30 mL of water.
5. Verify the client's identity (two identifiers), and explain the procedure to the client.
6. Don gloves; check tube placement and residual contents before instilling the medication; check for bowel sounds.
7. Flush with 30 to 60 mL of water or normal saline (NS), depending on agency policy.
8. Pinch off tubing, attach an irrigation syringe to the nasogastric tube, and pour the medication into the syringe. Release the pinch on the tubing immediately and allow medication to infuse via gravity.
9. Flush with 30 to 60 mL of water or normal saline (NS), depending on agency policy.
10. Clamp the tube for 30 to 60 minutes, depending on medication and agency policy.
11. Document the administration of the medication and any other appropriate information.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing.* (10th ed.). St. Louis: Elsevier. pp. 618-619.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

c. The tube enters the small intestine through the pyloric sphincter because of the weight of a small bag containing tungsten at the end.
d. Types of tubes include the Cantor tube (single lumen) and the Miller-Abbott tube (double lumen) (see Fig. 70.8).

2. Interventions
a. Assess the PHCP's prescriptions and agency policy for advancement and removal of the tube and tungsten.
b. Position the client on the right side to facilitate passage of the weighted bag in the tube through the pylorus of the stomach and into the small intestine.
c. Assess the abdomen during the procedure by monitoring drainage from the tube and the abdominal girth.
d. Do not secure the tube to the face with tape until it has reached final placement (may take several hours) in the intestines.
e. If the tube becomes blocked, notify the PHCP.
f. To remove the tube, the tungsten is removed from the balloon portion of the tube with a syringe; the tube is removed gradually (6 inches [15 cm] every hour) as prescribed by the PHCP.

J. Esophageal and gastric tubes
1. Description
a. May be used to apply pressure against bleeding esophageal veins to control the bleeding when other interventions are not effective or they are contraindicated
b. Not used if the client has ulceration or necrosis of the esophagus or has had previous esophageal surgery because of the risk of rupture

2. Sengstaken-Blakemore tube and Minnesota tube (see Fig. 70.8)
a. The Sengstaken-Blakemore tube, used only occasionally, is a triple-lumen gastric tube with an inflatable esophageal balloon (compresses esophageal varices), an inflatable gastric balloon (applies pressure at the cardioesophageal junction), and a gastric aspiration lumen. A nasogastric tube also is inserted in the opposite naris to collect secretions that accumulate above the esophageal balloon.
b. More commonly used is the Minnesota tube, which is a modified Sengstaken-Blakemore tube with an additional lumen (a four-lumen gastric tube) for aspirating esophagopharyngeal secretions.
c. A radiograph of the upper abdomen and chest confirms placement.

3. Interventions
a. Check patency and integrity of all balloons before insertion.
b. Label each lumen.
c. Place the client in the upright or Fowler's position for insertion.
d. Immediately after insertion, prepare for radiography to verify placement.
e. Maintain head elevation once the tube is in place.
f. Double-clamp the balloon ports to prevent air leaks.
g. Keep scissors at the bedside at all times; monitor for respiratory distress, and if it occurs, cut the tubes to deflate the balloons.
h. To prevent ulceration or necrosis of the esophagus, release esophageal pressure at intervals as prescribed and per agency policy.
i. Monitor for increased bloody drainage, which may indicate persistent bleeding and rupture of the varices.
j. Monitor for signs of esophageal rupture, which include a drop in blood pressure, increased heart rate, and back and upper abdominal pain. Esophageal rupture is an emergency, and signs of esophageal rupture must be reported to the PHCP immediately.

K. Lavage tubes
1. Used to remove toxic substances from the stomach
2. Types of tubes
a. Lavacuator: The Lavacuator is an orogastric tube with a large suction lumen and a smaller lavage–vent lumen that provides continuous suction; irrigation solution enters the lavage lumen while stomach contents are removed through the suction lumen.
b. Ewald tube: A single-lumen large tube used for rapid 1-time irrigation and evacuation

L. Urinary and renal tubes (see Chapter 17)

M. Respiratory system tubes
1. Endotracheal tubes (Fig. 70.9)
a. The endotracheal tube is used to maintain a patent airway.
b. Endotracheal tubes are indicated when the client needs mechanical ventilation.
c. If the client requires an artificial airway for longer than 10 to 14 days, a tracheostomy may be created to avoid mucosal and vocal cord damage that can be caused by the endotracheal tube.
d. The cuff (located at the distal end of the tube), when inflated, produces a seal between the trachea and the cuff to prevent aspiration and ensure delivery of a set tidal volume when mechanical ventilation is used; an inflated cuff also prevents air from passing to the vocal cords, nose, or mouth.
e. The pilot balloon permits air to be inserted into the cuff, prevents air from escaping, and is used as a guideline for determining the presence or absence of air in the cuff.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

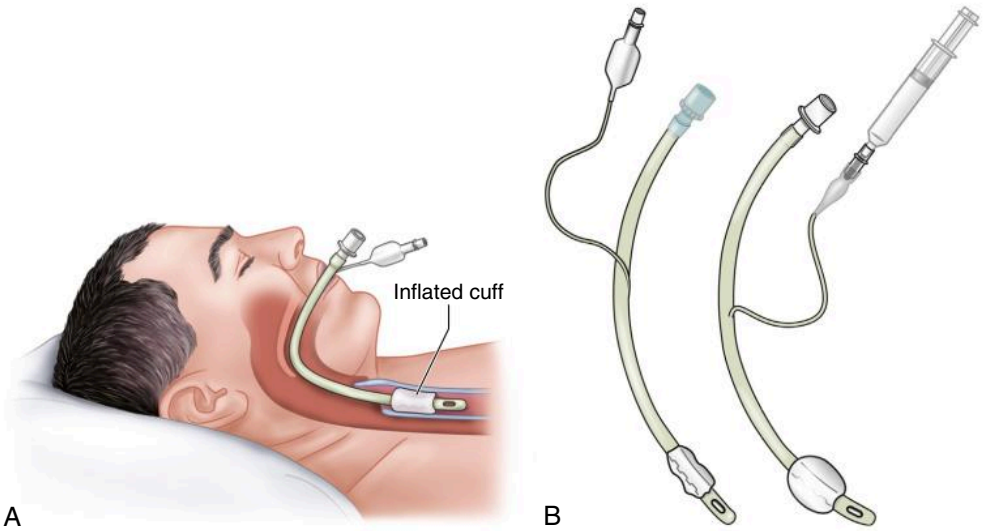


FIG. 70.9 **A,** Endotracheal (ET) tube with inflated cuff. **B,** ET tubes with uninflated and inflated cuffs and syringe for inflation.

f. The universal adapter enables attachment of the tube to mechanical ventilation tubing or other types of oxygen delivery systems.
g. Routes for intubation: orotracheal and nasotracheal

2. Orotracheal intubation
a. Endotracheal tube inserted through the mouth; allows use of a larger diameter tube as compared to the acceptable diameter used for nasotracheal intubation, and thus reduces the work of breathing
b. Indicated when the client has a nasal obstruction or a predisposition to epistaxis
c. Uncomfortable and can be manipulated by the tongue, causing airway obstruction; an oral airway may be needed to keep the client from biting on the tube.

3. Nasotracheal intubation
a. Endotracheal tube inserted through a nostril. A smaller tube must be used as compared to one used for orotracheal intubation; thus it increases resistance and the client's work of breathing.
b. Is placed blindly (without seeing the larynx)
c. Its use is avoided in clients with bleeding disorders.
d. Reserved for when oral intubation is not possible (unstable cervical spine injury, dental abscess, epiglottitis)

4. Interventions
a. Placement is initially confirmed via end-tidal CO_2 detector by confirming the presence of exhaled CO_2 from the lungs. This is done by placing the detector between the bag valve mask and the endotracheal tube (ET tube) and looking for color change (indicating the presence of CO_2).
b. Assess placement by auscultating both sides of the chest while manually ventilating with a resuscitation (Ambu) bag (if breath sounds and chest wall movement are absent in the left side, the tube may be in the right main stem bronchus).
c. Perform auscultation over the stomach to rule out esophageal intubation.
d. If the tube is in the stomach, louder breath sounds will be heard over the stomach than over the chest, and abdominal distention will be present.
e. Placement is finally confirmed by chest x-ray film (correct placement is 1 to 2 cm above the carina).
f. Secure the tube with adhesive tape immediately after intubation.
g. Monitor the position of the tube at the lip or nose.
h. Monitor skin and mucous membranes.
i. Suction the tube only when needed.
j. The oral tube needs to be moved to the opposite side of the mouth daily to prevent pressure and necrosis of the lip and mouth area, prevent nerve damage, and facilitate inspection and cleaning of the mouth; moving the tube to the opposite side of the mouth should be done by two health care providers.
k. Prevent dislodgment and pulling or tugging on the tube; suction, coughing, and speaking attempts by the client place extra stress on the tube and can cause dislodgment.
l. Assess the pilot balloon to ensure that the cuff is inflated; maintain cuff inflation, which creates a seal and allows complete mechanical control of respiration.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

m. Monitor cuff pressures at least every 8 hours per agency procedure to ensure that they do not exceed 20 mm Hg (an aneroid pressure manometer is used to measure cuff pressures); minimal leak and occlusive techniques are used for cuff inflation to check cuff pressures.

⚠ A resuscitation (Ambu) bag needs to be kept at the bedside of a client with an endotracheal tube or a tracheostomy tube at all times.

5. Minimal leak technique
   - **a.** This is used for cuff inflation and checking cuff pressures for cuffs without pressure-relief valves.
   - **b.** Inflate the cuff until a seal is established; no harsh sound should be heard through a stethoscope placed over the trachea when the client breathes in, but a slight air leak on peak inspiration is present and can be heard.
   - **c.** The client cannot make verbal sounds, and no air is felt coming out of the client's mouth.
6. Occlusive technique
   - **a.** This is used for cuff inflation and checking cuff pressures for cuffs with pressure-relief valves.
   - **b.** Provides an adequate seal in the trachea at the lowest possible cuff pressure
   - **c.** Uses same procedure as minimal leak technique, without an air leak
7. Extubation
   - **a.** Hyperoxygenate the client, and suction the endotracheal tube and the oral cavity.
   - **b.** Place the client in a semi-Fowler's position.
   - **c.** Deflate the cuff; have the client inhale and, at peak inspiration, remove the tube, suctioning the airway through the tube while pulling it out.
   - **d.** After removal, instruct the client to cough and deep-breathe to assist in removing accumulated secretions in the throat.
   - **e.** Apply oxygen therapy, as prescribed.
   - **f.** Have the client say their name to assess vocalization.
   - **g.** Assess for stridor (which can be caused by laryngeal edema) by auscultating over the trachea; if present, notify the PHCP immediately.
   - **h.** Monitor for respiratory difficulty; contact the PHCP if respiratory difficulty occurs.
   - **i.** Inform the client that hoarseness or a sore throat is normal and that the client should limit talking if either occurs.

N. Tracheostomy

1. A tracheostomy is an opening made surgically directly into the trachea to establish an airway; a tracheostomy tube is inserted into the opening and the tube attaches to the mechanical ventilator or another type of oxygen delivery device (Fig. 70.10).
2. Types: The tracheostomy can be temporary or permanent (Box 70.10).
3. Interventions
   - **a.** Assess respirations and for bilateral breath sounds.
   - **b.** Monitor arterial blood gases and pulse oximetry.
   - **c.** Encourage coughing and deep breathing.
   - **d.** Maintain a semi-Fowler's to high-Fowler's position.
   - **e.** Monitor for bleeding, difficulty with breathing, absence of breath sounds, and crepitus (subcutaneous emphysema), which are indications of hemorrhage or pneumothorax.
   - **f.** Provide respiratory treatments as prescribed.
   - **g.** Suction fluids as needed; hyperoxygenate the client before suctioning (Box 70.11).
   - **h.** If the client is allowed to eat, sit the client up for meals and ensure that the cuff is inflated (if the tube is not capped) for meals and for 1 hour after meals to prevent aspiration.
   - **i.** Monitor cuff pressures as prescribed.
   - **j.** Assess the stoma and secretions for blood or purulent drainage.
   - **k.** Follow the PHCP's prescriptions and agency policy for cleaning the tracheostomy site and inner cannula (many inner cannulas are disposable); usually, half-strength hydrogen peroxide or saline is used.
   - **l.** Administer humidified oxygen as prescribed, because the normal humidification process is bypassed in a client with a tracheostomy.
   - **m.** Obtain assistance in changing tracheostomy ties; after placing the new ties, cut and remove the old ties holding the tracheostomy in place (some securing devices are soft and made with Velcro to hold the tube in place).
   - **n.** Keep a resuscitation (Ambu) bag, obturator, clamps, and spare tracheostomy tube of the same size at the bedside.
4. Complications of a tracheostomy (Table 70.5)

⚠ Never insert a plug (cap) into a tracheostomy tube until the cuff is deflated and the inner cannula is removed; prior insertion prevents airflow to the client.

O. Chest Tube Drainage System

1. The chest tube drainage system returns negative pressure to the intrapleural space.
2. The system is used to remove abnormal accumulations of air and fluid from the pleural space (Fig. 70.11).
3. Drainage collection chamber (Fig. 70.12)

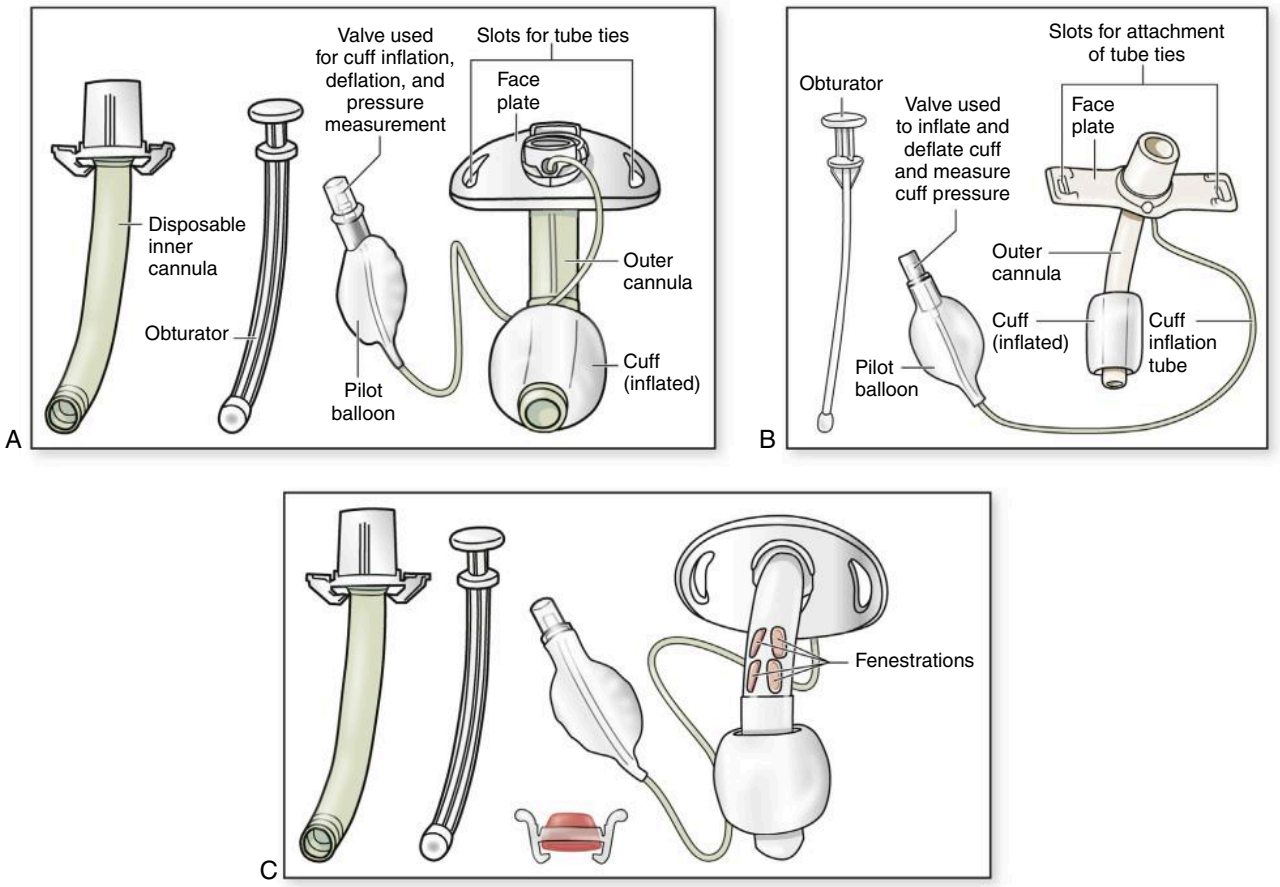

FIG. 70.10 Tracheostomy tubes. **A,** Double-lumen cuffed tracheostomy tube with disposable inner cannula. **B,** Single-lumen cannula cuffed tracheostomy tube. **C,** Double-lumen cuffed fenestrated tracheostomy tube with plug (red cap).

BOX 70.10 Some Types of Tracheostomy Tubes

Double-Lumen Tube

The double-lumen tube has the following parts:

Outer cannula—fits into the stoma and keeps the airway open. The face plate indicates the size and type of tube and has small holes on both sides for securing the tube with tracheostomy ties or another device.

Inner cannula—fits snugly into the outer cannula and locks into place. It provides the universal adapter for use with the ventilator and other respiratory therapy equipment. Some may be removed, cleaned, and reused; others are disposable.

Obturator—a stylet with a smooth end used to facilitate the direction of the tube when inserting or changing a tracheostomy tube. The obturator is removed immediately after tube placement; an obturator is always kept with the client and at the bedside in case of accidental decannulation.

Cuff—when inflated, seals the airway. The cuffed tube is used for mechanical ventilation, preventing aspiration of oral or gastric secretions, or for the client receiving a tube feeding to prevent aspiration. A pilot balloon attached to the outside of the tube indicates the presence or absence of air in the cuff.

Single-Lumen Tube

The single-lumen tube is similar to the double-lumen tube except that there is no inner cannula. More intensive nursing care is required with this tube because there is no inner cannula to ensure a patent lumen.

Fenestrated Tube

The fenestrated tube has a precut opening (fenestration) in the upper posterior wall of the outer cannula. The tube is used to wean the client from a tracheostomy by ensuring that the client can tolerate breathing through their natural airway before the entire tube is removed. This tube allows the client to speak.

Cuffed Fenestrated Tube

The cuffed fenestrated tube facilitates mechanical ventilation and speech and often is used for clients with spinal cord paralysis or neuromuscular disease who do not require ventilation at all times. When not on the ventilator, the client can have the cuff deflated and the tube capped (see Fig. 70.10 for cuffed fenestrated tube with red cap) for speech. A cuffed fenestrated tube is never used in weaning from a tracheostomy, because the cuff, even fully deflated, may partially obstruct the airway.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.11 Tracheal Suctioning

1. Assess the client and explain the procedure.
2. Assist the client to an upright position.
3. Perform hand hygiene and don personal protective equipment.
4. Prepare suctioning equipment and turn on the suction.
5. Hyperoxygenate the client.
6. Insert the catheter without suction applied.
7. Once inserted, apply suction intermittently while rotating and withdrawing the catheter.
8. Hyperoxygenate the client.
9. Listen to breath sounds and reassess oxygen saturation.
10. Document the procedure, client response, and effectiveness.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 509; Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 491, 493, 1551.

   a. The drainage collection chamber is located where the chest tube from the client connects to the system.
   b. Drainage from the tube drains into and collects in a series of calibrated columns in this chamber.

4. Water seal chamber (see Fig. 70.12)
   a. The tip of the tube is underwater, allowing fluid and air to drain from the pleural space and preventing air from entering the pleural space.
   b. Water oscillates (moves up as the client inhales and moves down as the client exhales).
   c. Excessive bubbling indicates an air leak in the chest tube system.
5. Suction control chamber (see Fig. 70.12)
   a. The suction control chamber provides the suction, which can be controlled to provide negative pressure to the chest.

TABLE 70.5 Complications of a Tracheostomy

Complication and Description	Manifestations	Management	Prevention
Tracheomalacia: Constant pressure exerted by the cuff causes tracheal dilation and erosion of cartilage.	▪ An increased amount of air is required in the cuff to maintain the seal. ▪ A larger tracheostomy tube is required to prevent an air leak at the stoma. ▪ Food particles are seen in tracheal secretions. ▪ The client does not receive the set tidal volume on the ventilator.	▪ Monitor client; no special management is needed unless bleeding or airway problems occur.	▪ Monitor cuff pressure and air volume closely to detect changes. ▪ Use an uncuffed tube as soon as possible.
Tracheal stenosis: Narrowed tracheal lumen is the result of scar formation from irritation of tracheal mucosa by the cuff.	▪ Stenosis is usually seen after the cuff is deflated or the tracheostomy tube is removed. ▪ The client has increased coughing, inability to expectorate secretions, or difficulty breathing and talking.	▪ Tracheal dilation or surgical intervention is used.	▪ Prevent pulling of and traction on the tracheostomy tube. ▪ Properly secure the tube in the midline position. ▪ Maintain cuff pressure. ▪ Minimize oronasal intubation time.
Tracheoesophageal fistula (TEF): Excessive cuff pressure causes erosion of the posterior wall of the trachea. A hole is created between the trachea and the anterior esophagus. The client at highest risk also has a nasogastric tube present.	Similar to tracheomalacia: ▪ Food particles are seen in tracheal secretions. ▪ Increased air in cuff is needed to achieve a seal. ▪ The client has increased coughing and choking while eating. ▪ The client does not receive the set tidal volume on the ventilator.	▪ Suction; manually administer oxygen by mask to prevent hypoxemia. ▪ Use a small soft feeding tube instead of a nasogastric tube for tube feedings. ▪ A gastrostomy or jejunostomy may be performed. ▪ Monitor the client with a nasogastric tube closely; assess for TEF and aspiration.	▪ Maintain cuff pressure. ▪ Monitor the amount of air needed for inflation to detect changes. ▪ Progress to a deflated or cuffless tube as soon as possible.
Trachea–innominate artery fistula: A malpositioned tube causes its distal tip to push against the lateral wall of the trachea. Continued pressure causes necrosis and erosion of the innominate artery. *This is a medical emergency.*	▪ The tracheostomy tube pulsates in synchrony with the heartbeat. ▪ There is heavy bleeding from the stoma. ▪ This is a life-threatening complication.	▪ Apply direct pressure to the innominate artery at the stoma site. ▪ The tracheostomy tube will be removed immediately. ▪ Prepare the client for immediate repair surgery.	▪ Use the correct tube size and length, and maintain the tube in midline position. ▪ Prevent pulling or tugging of the tracheostomy tube. ▪ Immediately notify the PHCP of a pulsating tube.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.5 Complications of a Tracheostomy—cont'd

Complication and Description	Manifestations	Management	Prevention
Tube obstruction	▪ Difficulty breathing ▪ Noisy respirations ▪ Difficulty inserting the suction catheter ▪ Thick, dry secretions ▪ Unexplained peak pressures if client is on a mechanical ventilator	▪ The PHCP repositions or replaces the tube if obstruction occurs as a result of cuff prolapse over the end of the tube.	▪ Assist the client to cough and deep-breathe. ▪ Provide humidification and suctioning. ▪ Clean the inner cannula regularly.

Tube dislodgment	▪ Difficulty breathing
	▪ Noisy respirations
	▪ Restlessness
	▪ Excessive coughing
	▪ Audible wheeze or stridor
		▪ Be familiar with institutional policy regarding replacement of a tracheostomy tube as a nursing procedure.
		▪ During the first 72 hours following surgical placement of the tracheostomy, the nurse manually ventilates the client by using a manual resuscitation (Ambu) bag while another nurse calls the Rapid Response Team for help.
		▪ 72 hours following surgical placement of the tracheostomy:
		  ▪ Extend the client's neck and open the tissues of the stoma to secure the airway.
		  ▪ Grasp the retention sutures (if they are present) to spread the opening.
		  ▪ Use a tracheal dilator (curved clamp) to hold the stoma open.
		  ▪ Prepare to insert a tracheostomy tube; place the obturator into the tracheostomy tube, insert the tube, and remove the obturator.
		  ▪ Maintain ventilation by resuscitation (Ambu) bag.
		  ▪ Assess airflow and bilateral breath sounds.
		  ▪ If unable to secure an airway, call the Rapid Response Team and the anesthesiologist.
			▪ Secure the tube in place.
			▪ Minimize manipulation of and traction on the tube.
			▪ Ensure that the client does not pull on the tube.
			▪ Ensure that a tracheostomy tube of the same type and size is at the client's bedside.

Adapted from Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 466.

b. This chamber is filled with various levels of water to achieve the desired level of suction; without this control, lung tissue could be sucked into the chest tube.

c. Gentle bubbling in this chamber indicates that there is suction and does not indicate that air is escaping from the pleural space.

6. Dry suction system (see Fig. 70.12)

a. This is another type of chest drainage system. Because this is a dry suction system, absence of bubbling is noted in the suction control chamber.

b. A knob on the collection device is used to set the prescribed amount of suction; then the wall suction source dial is turned until a small orange floater valve appears in the window on the device (when the orange floater valve is in the window, the correct amount of suction is applied).

7. Portable chest drainage system: Small and portable chest drainage systems are also available and are dry systems that use a control flutter valve to prevent the backflow of air into the client's lung. Principles of gravity and pressure, and the nursing care involved, are the same for all types of systems, and these systems allow greater ambulation and allow the client to go home with the chest tubes in place.

8. Collection chamber: Interventions

a. Monitor drainage; notify the PHCP if drainage is more than 70 to 100 mL/hr or if drainage becomes bright red or increases suddenly.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

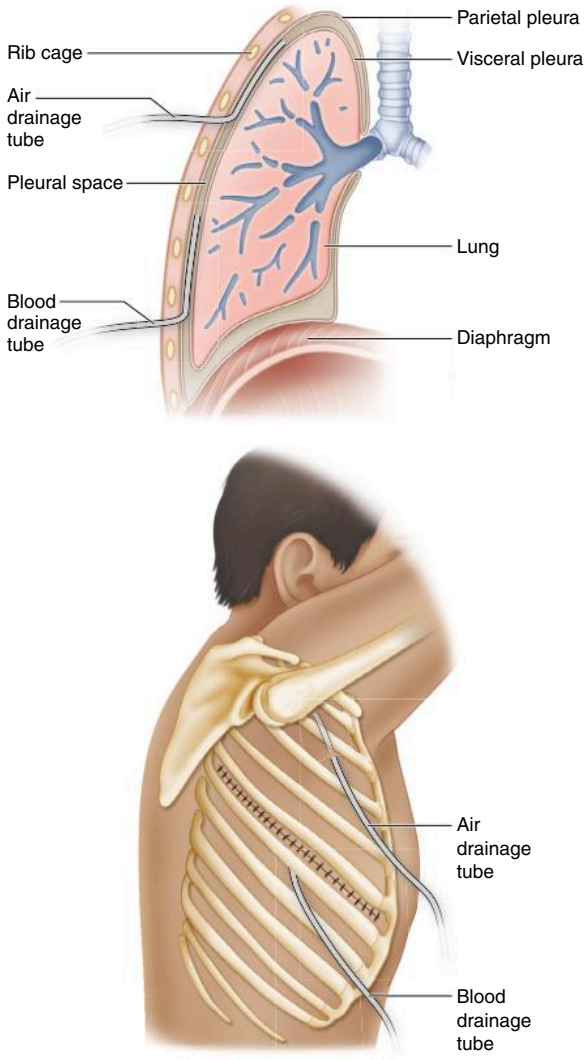

FIG. 70.11 Chest tube placement.

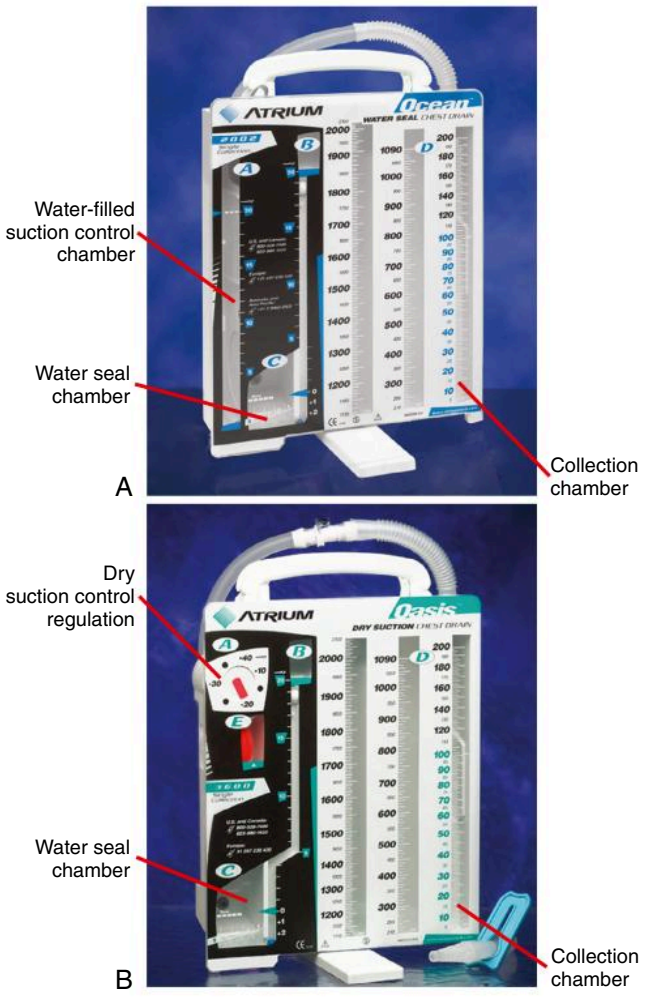

FIG. 70.12 Chest drainage system. **A,** Wet system. **B,** Dry system. (From Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. [2020]. *Medical-surgical nursing: Assessment and management of clinical problems.* [11th ed.]. St. Louis: Elsevier. p. 526.)

b. Mark the chest tube drainage in the collection chamber at 1- to 4-hour intervals, using a permanent marker.

9. Water seal chamber: Interventions
- **a.** Monitor for fluctuation of the fluid level in the water seal chamber.
- **b.** Fluctuation in the water seal chamber stops if the tube is kinked or obstructed, if a dependent loop exists, if the suction is not working properly, or if the lung has re-expanded (resolved pneumothorax).
- **c.** If the client has a known pneumothorax, intermittent bubbling in the water seal chamber is expected as air is drained from the chest, but continuous bubbling indicates an air leak in the system.
- **d.** Notify the PHCP if there is continuous bubbling in the water seal chamber.

10. Suction control chamber: Interventions: Gentle (not vigorous) bubbling should be noted in the suction control chamber of a wet suction system.

11. Additional interventions
- **a.** An occlusive sterile dressing is maintained at the insertion site.
- **b.** A chest radiograph assesses the position of the tube and determines whether the lung has re-expanded.
- **c.** Assess respiratory status and auscultate lung sounds. Assess chest tube dressing for drainage, and palpate surrounding tissue for crepitus.
- **d.** Monitor for signs of extended pneumothorax or hemothorax.
- **e.** Keep the drainage system below the level of the chest and the tubes free of kinks, dependent loops, or other obstructions.
- **f.** Ensure that all connections are secure.
- **g.** Encourage coughing and deep breathing.
- **h.** Change the client's position frequently to promote drainage and ventilation.
- **i.** Do not strip or milk a chest tube unless specifically directed to do so by the PHCP and if agency policy allows it.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

j. Keep a clamp (may be needed if the system needs to be changed) and a sterile occlusive dressing at the bedside at all times.

k. Never clamp a chest tube without a written prescription from the PHCP; also, determine agency policy for clamping a chest tube.

l. If the drainage system cracks or breaks, insert the chest tube into a bottle of sterile water, remove the cracked or broken system, and replace it with a new system.

m. Depending on the PHCP's preference, when the chest tube is removed, the client may be asked to take a deep breath and hold it, and the tube is removed. Or, the client may be asked to take a deep breath, exhale, and bear down (Valsalva maneuver). A dry sterile dressing, petroleum gauze dressing, or Telfa dressing (depending on the PHCP's preference) is taped in place after removal of the chest tube.

⚠ If the chest tube is pulled out of the chest accidentally, pinch the skin opening together, apply an occlusive sterile dressing, cover the dressing with overlapping pieces of 2-inch (5-cm) tape, and call the PHCP immediately.

V. Complex Integumentary Problems

A. Burn injuries (see Clinical Judgment: Take Action box)

CLINICAL JUDGMENT: TAKE ACTION

A client who sustained a burn injury over 20% of the body from an industrial explosion arrives at the emergency department via emergency medical services. The emergency department nurse takes the following actions in the care of the client:

- Assesses for airway patency
- Administers resuscitation measures as needed
- Administers oxygen
- Obtains vital signs
- Ensures that an intravenous (IV) line was initiated and administers fluid replacement as prescribed
- Administers IV pain medication
- Elevates the extremities if no fractures are obvious
- Keeps the client warm and places the client on NPO (nothing by mouth) status
- Prepares for additional interventions, tests, and treatments for wounds

1. Description: Cell destruction of the layers of the skin caused by heat, friction, electricity, radiation, or chemicals.

2. Small burns: The response of the body to injury is localized to the injured area.

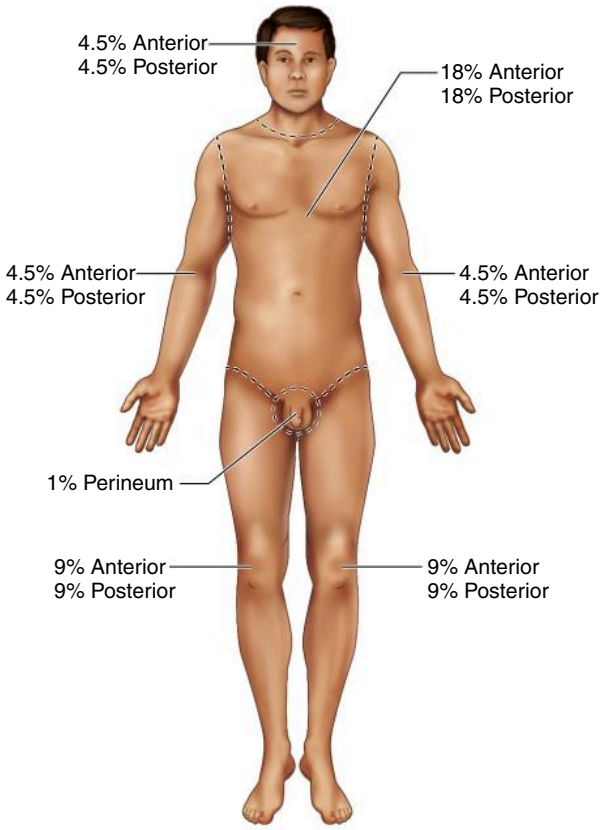

FIG. 70.13 The rule of nines for estimating burn percentage.

3. Large or extensive burns:

a. Major or extensive burns consist of 25% or more of the total body surface area for an adult and 10% or more of the total body surface for a child.

b. The response of the body to the injury is systemic.

c. The burn affects all major systems of the body.

d. Electrical burns often involve a surface injury that is small but internal injuries that may be extensive.

4. Estimating the extent of injury (Fig. 70.13)

B. Burn depth

1. Superficial-thickness burn

a. Involves injury to the epidermis; the blood supply to the dermis is still intact.

b. Mild to severe erythema (pink to red) is present, but no blisters.

c. Skin blanches with pressure.

d. Burn is painful, with tingling sensation, and the pain is eased by cooling.

e. Discomfort lasts about 48 hours; healing occurs in about 3 to 6 days.

f. No scarring occurs and skin grafts are not required.

2. Superficial partial-thickness burn (Fig. 70.14)

a. Involves injury deeper into the dermis; the blood supply is reduced.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

FIG. 70.14 Typical appearance of superficial partial-thickness burn injury. (From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. [2021]. *Medical-surgical nursing: Concepts for interprofessional collaborative care.* [10th ed.]. St. Louis: Elsevier. p. 462.)

FIG. 70.15 Typical appearance of deep partial-thickness burn injury. (From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. [2021]. *Medical-surgical nursing: Concepts for interprofessional collaborative care.* [10th ed.]. St. Louis: Elsevier. p. 462.)

FIG. 70.16 Typical appearance of full-thickness burn injury. (From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. [2021]. *Medical-surgical nursing: Concepts for interprofessional collaborative care.* [10th ed.]. St. Louis: Elsevier. p. 462.)

b. Large blisters may cover an extensive area.
c. Edema is present.
d. Mottled pink to red base and broken epidermis, with a wet, shiny, and weeping surface, are characteristic.
e. Burn is painful and sensitive to cold air.
f. Heals in 10 to 21 days with no scarring, but some minor pigment changes may occur.
g. Grafts may be used if the healing process is prolonged.

3. **Deep partial-thickness burn** (Fig. 70.15)
   a. Extends deeper into the skin dermis
   b. Blister formation usually does not occur because the dead tissue layer is thick and sticks to underlying viable dermis.
   c. Wound surface is red and dry with white areas in deeper parts.
   d. May or may not blanch, and edema is moderate.
   e. Can convert to full-thickness burn if tissue damage increases with infection, hypoxia, or ischemia.
   f. Generally heals in 3 to 6 weeks, but scar formation results and skin grafting may be necessary.
4. **Full-thickness burn** (Fig. 70.16)
   a. Involves injury and destruction of the epidermis and the dermis; the wound will not heal by re-epithelialization, and grafting may be required.
   b. Appears as a dry, hard, leathery eschar (burn crust or dead tissue must slough off or be removed from the wound before healing can occur)
   c. Appears waxy white, deep red, yellow, brown, or black
   d. Injured surface appears dry.
   e. Edema is present under the eschar.
   f. Sensation is reduced or absent because of nerve-ending destruction.
   g. Healing may take weeks to months and depends on establishing an adequate blood supply.
   h. Burn requires removal of eschar and split- or full-thickness skin grafting.
   i. Scarring and wound contractures are likely to develop.
5. **Deep full-thickness burn** (Fig. 70.17)
   a. Injury extends beyond the skin into underlying fascia and tissues, and muscle, bone, and tendons are damaged.
   b. Injured area appears black, and sensation is completely absent.
   c. Eschar is hard and inelastic.
   d. There is a lack of pain because nerve endings have been destroyed.
   e. Healing takes months, and grafts are required.

C. Burn location
1. Burns of the head, neck, and chest are associated with pulmonary complications.
2. Burns of the face are associated with corneal abrasion.
3. Burns of the ear are associated with auricular chondritis.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

FIG. 70.17 Typical appearance of deep full-thickness burn injury. (From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. [2021]. *Medical-surgical nursing: Concepts for interprofessional collaborative care.* [10th ed.]. St. Louis: Elsevier. p. 462.)

4. Hands and joints require intensive therapy to prevent disability.
5. The perineal area is prone to autocontamination by urine and feces.
6. Circumferential burns of the extremities can produce a tourniquet-like effect and lead to vascular compromise (compartment syndrome).
7. Circumferential thorax burns lead to inadequate chest wall expansion and pulmonary insufficiency.

D. Age and general health
1. Mortality rates are higher for children younger than 4 years of age, particularly for children from birth to 1 year of age, and for clients older than 65 years.
2. Debilitating disorders, such as cardiac, respiratory, endocrine, and renal disorders, negatively influence the client's response to injury and treatment.
3. Mortality rate is higher when the client has a preexisting disorder at the time of the burn injury.

E. Inhalation injuries
1. **Smoke inhalation injury**
   a. Respiratory injury that occurs when the victim inhales products of combustion during a fire

⚠ The airway is a priority concern in an inhalation injury.

   b. Assessment (Box 70.12)
2. **Carbon monoxide poisoning**
   a. Carbon monoxide is a colorless, odorless, and tasteless gas that has an affinity for hemoglobin 200 times greater than that of oxygen.
   b. Oxygen molecules are displaced, and carbon monoxide reversibly binds to hemoglobin to form carboxyhemoglobin.
   c. Tissue hypoxia occurs.
   d. Assessment (Table 70.6)

BOX 70.12 Assessment Findings in a Smoke Inhalation Injury

- Facial burns
- Erythema
- Swelling of oropharynx and nasopharynx
- Singed nasal hairs
- Flaring nostrils
- Stridor, wheezing, and dyspnea
- Hoarse voice
- Sooty (carbonaceous) sputum and cough
- Tachycardia
- Agitation and anxiety

TABLE 70.6 Carbon Monoxide Poisoning

Blood Level (%)	Clinical Manifestations
1-10	Normal level
11-20 (mild poisoning)	Headache Flushing Decreased visual acuity Decreased cerebral functioning Slight breathlessness
21-40 (moderate poisoning)	Headache Nausea and vomiting Drowsiness Tinnitus and vertigo Confusion and stupor Pale to reddish-purple skin Decreased blood pressure Increased and irregular heart rate Depressed ST segment on electrocardiogram
41-60 (severe poisoning)	Coma Seizures Cardiopulmonary instability
61-80 (fatal poisoning)	Death

Adapted from Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 464-465.

3. Direct thermal heat injury
   a. Thermal heat injury can occur to the lower airways by the inhalation of steam or explosive gases or the aspiration of scalding liquids.
   b. Injury can occur to the upper airways, which appear erythematous and edematous, with mucosal blisters and ulcerations.
   c. Mucosal edema can lead to upper airway obstruction, especially during the first 24 to 48 hours.
   d. All clients with head or neck burns should be monitored closely for the development of airway obstruction and are considered immediately for endotracheal intubation if obstruction occurs.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

e. Assessment: Findings include erythema and edema of the upper airways and mucosal blisters and ulcerations.

F. Pathophysiology of burns

1. Following a burn, vasoactive substances are released from the injured tissue, and these substances cause an increase in capillary permeability, allowing the plasma to seep into the surrounding tissues.

2. The direct injury to the vessels increases capillary permeability (capillary permeability decreases 18 to 26 hours after the burn but does not normalize until 2 to 3 weeks following injury).

3. Extensive burns result in generalized body edema and a decrease in circulating intravascular blood volume.

4. The fluid losses result in a decrease in organ perfusion.

5. The heart rate increases, cardiac output decreases, and blood pressure drops.

6. Initially, hyponatremia and hyperkalemia occur.

7. The hematocrit level increases as a result of plasma loss; this initial increase falls to below normal by the third to fourth day after the burn as a result of red blood cell damage and loss at the time of injury.

8. Initially, the body shunts blood from the kidneys, causing oliguria; then the body begins to reabsorb fluid, and diuresis of the excess fluid occurs over the next days to weeks.

9. Blood flow to the gastrointestinal tract is diminished, leading to intestinal ileus and gastrointestinal dysfunction.

10. Immune system function is depressed, resulting in immunosuppression and thus increasing the risk of infection and sepsis.

11. Pulmonary hypertension can develop, resulting in a decrease in the arterial oxygen tension level and a decrease in lung compliance.

12. Evaporative fluid losses through the burn wound are greater than normal, and the losses continue until complete wound closure occurs.

13. If the intravascular space is not replenished with intravenously administered fluids, hypovolemic shock and ultimately death occur.

G. Management of the burn injury: Resuscitation/emergent phase (Table 70.7)

1. Prehospital care

a. Begins at the scene of the accident and ends when emergency care is obtained

b. Remove the victim from the source of the burn.

c. Assess the ABCs—airway, breathing, and circulation.

TABLE 70.7 Phases of Management of the Burn Injury

Phase	Goal
Resuscitation/Emergent Phase Begins at the time of injury Ends with the restoration of normal capillary permeability Duration usually 48-72 hr Includes prehospital care and emergency department care	The primary goal is to maintain a patent airway, administer intravenous fluids to prevent hypovolemic shock, and preserve vital organ functioning.
Resuscitative Phase Begins with the initiation of fluids Ends when capillary integrity returns to near-normal levels and large fluid shifts have decreased Amount of fluid administered is based on client's weight and extent of injury Note that most fluid replacement formulas are calculated from the time of injury and not from the time of arrival at the hospital.	The goal is to prevent shock by maintaining adequate circulating blood volume and maintaining vital organ perfusion.
Acute Phase Begins when the client is hemodynamically stable, capillary permeability is restored, and diuresis has begun Usually begins 48-72 hr after time of injury Focus on infection control, wound care, wound closure, nutritional support, pain management, and physical therapy	The emphasis during this phase is placed on restorative therapy, and the phase continues until wound closure is achieved.
Rehabilitative Phase Overlaps acute phase of care Extends beyond hospitalization	The goals of this phase are designed so that the client can gain independence and achieve maximal function.

d. Assess for associated trauma, including inhalation injury.

e. Conserve body heat.

f. Cover burns with sterile or clean cloths.

g. Remove constricting jewelry and clothing.

h. Insert IV access.

i. Transport to the emergency department.

2. Emergency department care is a continuation of care administered at the scene of the injury.

3. Major burns

a. Evaluate the degree and extent of the burn and treat life-threatening conditions.

b. Ensure a patent airway, and administer 100% oxygen as prescribed.

c. Monitor for respiratory distress and assess the need for intubation.

d. Assess the oropharynx for blisters and erythema; assess vocal quality and for singed nasal hairs and auscultate lung sounds.

e. Monitor arterial blood gases and carboxyhemoglobin levels.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

f. For an inhalation injury, administer 100% oxygen via a tight-fitting nonrebreather face mask as prescribed until the carboxyhemoglobin level falls below 15%.
g. Initiate peripheral IV access to nonburned skin proximal to any extremity burn, or prepare for the insertion of a central venous line as prescribed.
h. Assess for hypovolemia and prepare to administer fluids intravenously to maintain fluid balance.
i. Monitor vital signs closely.
j. Insert a Foley catheter as prescribed, and manage fluid resuscitation with a goal to maintain urine output at 30 to 50 mL/hr.
k. Maintain NPO (nothing by mouth) status.
l. Insert a nasogastric tube as prescribed to remove gastric secretions and prevent aspiration.
m. Administer tetanus prophylaxis as prescribed.
n. Administer pain medication, as prescribed, by the IV route.
o. Administer wound care and prepare the client for an escharotomy or fasciotomy as prescribed.

4. Minor burns
   a. Administer pain medication as prescribed.
   b. Instruct the client in the use of oral analgesics as prescribed.
   c. Administer tetanus prophylaxis as prescribed.
   d. Administer wound care as prescribed, which may include cleansing, debriding loose tissue, and removing any damaging agents, followed by the application of topical antimicrobial cream and a sterile dressing.
   e. Instruct the client in follow-up care, including active range-of-motion exercises and wound care treatments.

H. Management of the burn injury: Resuscitative phase (see Table 70.7)

1. Fluid resuscitation (Table 70.8)
   a. The amount of fluid administered depends on how much IV fluid per hour is required to maintain a urinary output of 30 to 50 mL/hr.
   b. Successful fluid resuscitation is evaluated by stable vital signs, an adequate urine output, palpable peripheral pulses, and intact level of consciousness and thought processes.
   c. IV fluid replacement may be titrated (adjusted) on the basis of urinary output plus serum electrolyte levels to meet the perfusion needs of the client with burns.
   d. If the hemoglobin and hematocrit levels decrease or if the urinary output exceeds 50 mL/hr, the rate of IV fluid administration may be decreased.

TABLE 70.8 Common Fluid Resuscitation Formulas for First 24 Hours After a Burn Injury[a]

Formula	Solution	Amount
Modified Brooke		
	5% albumin in isotonic saline	0.5 mL to 15 mL/kg/% TBSA burn
	Lactated Ringer's without dextrose	
Parkland (Baxter)		
	Crystalloid only (lactated Ringer's)	4 mL/kg/% TBSA burn
Modified Parkland		
	Crystalloid only (lactated Ringer's)	4 mL/kg/% TBSA burn + 15 mL/m² of TBSA

[a]The 2018 Advanced Burn Life Support Provider Manual from the American Burn Association recommends that adult thermal and chemical burns receive 2 mL LR × body weight in kg × % second- and third-degree burns, with half of the 24-hour total (in mL) infused over the first 8 hours. See http://ameriburn.org/wp-content/uploads/2019/08/2018-abls-providermanual.pdf

TBSA, Total body surface area.

From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 1293.

Urinary output is the most reliable and most sensitive noninvasive assessment parameter for cardiac output and tissue perfusion.

2. Interventions
   a. Monitor for tracheal or laryngeal edema, and administer respiratory treatments as prescribed; intubation and mechanical ventilation are instituted with respiratory burns before complications develop, if needed.
   b. Monitor pulse oximetry and prepare for arterial blood gases and carboxyhemoglobin levels if inhalation injury is suspected.
   c. Elevate the head of the bed to 30 degrees or more for burns of the face and head.
   d. Monitor for fluid overload and pulmonary edema.
   e. Initiate electrocardiographic (ECG) monitoring.
   f. Monitor temperature and assess for infection.
   g. Initiate protective isolation techniques; maintain strict handwashing; use sterile sheets and linens when caring for the client; and use gloves, cap, masks, shoe covers, scrub clothes, and plastic aprons.
   h. Clip body hair around wound margins.
   i. Monitor daily weights, expecting a weight gain of 6 to 9 kilograms (15 to 20 pounds) in the first 72 hours.
   j. Monitor gastric output and pH levels and for gastric discomfort and bleeding, indicating a stress ulcer.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

k. Administer antacids, H2 receptor antagonists, and antiulcer medications as prescribed to prevent a stress ulcer.
l. Auscultate bowel sounds for ileus, and monitor for abdominal distention and gastrointestinal dysfunction.
m. Monitor stools for occult blood.
n. Obtain urine specimen for myoglobin and hemoglobin levels.
o. Monitor IV fluids and hourly intake and output to determine the adequacy of fluid replacement therapy; notify the PHCP if urine output is less than 30 or greater than 50 mL/hr. Monitor serum laboratory results, including electrolytes and complete blood count.
p. Elevate circumferential burns of the extremities on pillows above the level of the heart to reduce dependent edema if no obvious fractures are present; diuretics increase the risk of hypovolemia and are generally avoided as a means of decreasing edema.
q. Monitor pulses and capillary refill of the affected extremities, and assess perfusion of the distal extremity with a circumferential burn.
r. Prepare to obtain chest x-rays and other radiographs to rule out fractures or associated trauma.
s. Keep the room temperature warm.
t. Place the client on an air-fluidized bed or other special mattress, and use a bed cradle to keep sheets off the client's skin.

3. Pain management
a. Administer opioid analgesics as prescribed by the IV route.
b. Avoid administering medication by the oral route because of the possibility of gastrointestinal dysfunction.
c. Medicate the client as prescribed and before painful procedures.

Avoid the intramuscular or subcutaneous medication route for medication administration, because absorption through the soft tissue is unreliable when hypovolemia and large fluid shifts occur.

4. Nutrition
a. Proper nutrition is essential to promote wound healing and prevent infection.
b. The basal metabolic rate is 40 to 100 times higher than normal with a burn injury.
c. Maintain NPO status until bowel sounds are heard; then advance to clear liquids as prescribed.
d. Dietary consultation may be prescribed. Nutrition may be provided via enteral tube feeding or parenteral nutrition through a central line.
e. Provide a diet high in protein, carbohydrates, fats, and vitamins, with major burns requiring more than 5000 calories daily.
f. Monitor calorie intake and daily weights.

I. Management of the burn injury: Acute phase (see Table 70.7)
1. Continue with protective isolation techniques.
2. Provide wound care as prescribed and prepare for wound closure.
3. Provide pain management.
4. Provide adequate nutrition as prescribed.
5. Prepare the client for rehabilitation.

J. Circulatory compromise treatments
1. Escharotomy
a. A lengthwise incision is made through the burn eschar to relieve constriction and pressure and to improve circulation.
b. Escharotomy is performed for circulatory compromise caused by circumferential burns.
c. Escharotomy can be performed at the bedside without anesthesia, because nerve endings have been destroyed by the burn injury.
d. Escharotomy may be necessary on the thorax to improve ventilation.
e. Following the escharotomy, assess pulses, color, movement, and sensation of affected extremity, and control any bleeding with pressure.
f. Pack the incision gently with fine mesh gauze as prescribed after escharotomy.
g. Apply topical antimicrobial agents to the area as prescribed.
2. Fasciotomy
a. An incision is made, extending through the subcutaneous tissue and fascia.
b. The procedure is performed if adequate tissue perfusion does not return following an escharotomy.
c. Fasciotomy is performed in the operating room with the client under general anesthesia.
d. Following the procedure, assess pulses, color, movement, and sensation of affected extremity, and control any bleeding with pressure.
e. Apply topical antimicrobial agents and dressings to the area, as prescribed.

K. Wound care
1. Description: Cleansing, debridement, and dressing of burn wounds
2. Hydrotherapy
a. Wounds are cleansed by showering on a special table, or washing small areas of wound at the bedside.
b. Hydrotherapy occurs for 30 minutes or less to prevent increased sodium loss through the burn wound, heat loss, pain, and stress.
c. Client should be premedicated before procedure.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

d. Hydrotherapy is not used for clients who are hemodynamically unstable or those with new skin grafts.
e. Care is taken to minimize bleeding and maintain body temperature during the procedure.
f. Prescribed antimicrobial agents are applied after hydrotherapy.

3. Debridement
   a. Debridement is removal of eschar or necrotic tissue to prevent bacterial proliferation under the eschar and to promote wound healing.
   b. Debridement may be mechanical, enzymatic, or surgical.
   c. Deep partial-thickness burns or deep full-thickness burns: Wound is cleansed and debrided, and topical antimicrobial agents are applied once or twice daily.
4. Wound closure
   a. Wound closure prevents infection and loss of fluid.
   b. Closure promotes healing.
   c. Closure prevents contractures.
   d. Wound closure is performed usually on day 5 to 21 following the injury, depending on the extent of the burn.
5. Wound coverings (Box 70.13)
6. Autografting
   a. Autografting is the surgical removal of a thin layer of the client's own unburned skin, which then is applied to the excised burn wound.
   b. Autografting provides permanent wound coverage.
   c. Autografting is performed in the operating room under anesthesia.
   d. Monitor for bleeding following the graft procedure, because bleeding beneath an autograft can prevent adherence.
   e. If prescribed, small amounts of blood or serum can be removed by gently rolling the fluid from the center of the graft to the periphery with a sterile gauze pad, where it can be absorbed.
   f. For large accumulations of blood, the PHCP may aspirate the blood using a small-gauge needle and syringe.
   g. Autografts are immobilized following surgery for 3 to 7 days to allow time to adhere and attach to the wound bed.
   h. Position the client for immobilization and elevation of the graft site to prevent movement and shearing of the graft.

BOX 70.13 Wound Coverings

Biological

Amniotic Membranes

- Amniotic membrane from human placenta is used; it adheres to the wound.
- Effective as a dressing until epithelial cell regrowth occurs
- Requires frequent changes/application because it does not develop a blood supply and disintegrates in about 48 hours

Allograft or Homograft (Human Tissue)

- Donated human cadaver skin provided through a skin bank
- Monitor for wound exudate and signs of infection.
- Rejection can occur within 24 hours.
- Risk of transmitting bloodborne infection exists when used.

Xenograft or Heterograft (Animal Tissue)

- Pigskin harvested after slaughter is preserved for storage and use.
- Monitor for infection and wound adherence.
- Placed over granulation tissue; replaced every 2 to 5 days until wound heals naturally or until closure with autograft is complete

Cultured Skin

- Grown in laboratory from a small specimen of epidermal cells from an unburned portion of the client's body
- Cell sheets are grafted on the client to generate permanent skin surface.
- Cell sheets are not durable; care must be taken when applying to ensure adherence and prevent sloughing.

Artificial Skin

- Consists of two layers—Silastic epidermis and porous dermis made from bovine hide collagen and shark cartilage
- After application, fibroblasts move into the collagen part of the artificial skin and create a structure similar to normal dermis.
- Artificial dermis then dissolves; it is then replaced with normal blood vessels and connective tissue called *neodermis*.
- Neodermis supports the standard autograft placed over it when the Silastic layer is removed.

Biosynthetic

- Combination of biosynthetic and synthetic materials
- Placed in contact with the wound surface; forms an adherent bond until epithelialization occurs
- Porous substance allows exudate to pass through.
- Monitor for wound exudate and signs of infection.

Synthetic

- Applied directly to the surface of a clean or surgically prepared wound; remains in place until it falls off or is removed
- Covering is transparent or translucent; therefore, wound can be inspected without removing dressing.
- Pain at the wound site is reduced because the covering prevents contact of the wound with air.

Autograft

- Skin taken from a remote unburned area of the client's own body; transplanted to cover burn wound
- Graft placed on a clean granulated bed or over surgically excised area of the burn
- Provides for permanent skin coverage

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

7. Care of the graft site
   a. Elevate and immobilize the graft site.
   b. Keep the site free from pressure.
   c. Avoid weight bearing.
   d. When the graft takes, if prescribed, roll a cotton-tipped applicator over the graft to remove exudate, because exudate can lead to infection and prevent graft adherence.
   e. Monitor for foul-smelling drainage, increased temperature, increased white blood cell count, hematoma formation, and fluid accumulation.
   f. Instruct the client to avoid using fabric softeners and harsh detergents in the laundry.
   g. Instruct the client to lubricate the healing skin with prescribed agents.
   h. Instruct the client to protect the affected area from sunlight.
   i. Instruct the client to use splints and support garments as prescribed.
8. Care of the donor site
   a. Method of care varies, depending on the PHCP's preference.
   b. A nonadherent gauze dressing may be applied at the time of the surgery to maintain pressure and stop any oozing; covering the site decreases discomfort from exposed nerve endings; always check the surgeon's preference.
   c. The PHCP may prescribe site treatment with gauze impregnated with petrolatum or with a biosynthetic dressing.
   d. Keep the donor site clean, dry, and free from pressure.
   e. Prevent the client from scratching the donor site.
   f. Apply lubricating lotions to soften the area and reduce the itching after the donor site is healed.
   g. Donor site can be reused once healing has occurred (heals spontaneously within 7 to 14 days with proper care).

L. Rehabilitative phase (see Table 70.7)
1. Description: Rehabilitation is the final phase of burn care.
2. Goals
   a. Promote wound healing.
   b. Minimize deformities.
   c. Increase strength and function.
   d. Provide emotional support.

M. Physical therapy
1. An individualized program of splinting, positioning, exercises, ambulation, and activities of daily living is implemented early in the acute phase of recovery to maximize functional and cosmetic outcomes.
2. Perform range-of-motion exercises as prescribed to reduce edema and maintain strength and joint function.
3. Ambulate the client as prescribed to maintain the strength of the lower extremities.
4. Apply splints as prescribed to maintain proper joint position and prevent contractures.
   a. Static splints immobilize the joint and are applied for periods of immobilization, during sleeping, and for clients who cannot maintain proper positioning.
   b. Dynamic splints exercise the affected joint.
   c. Avoid pressure to skin areas when applying splints, which could lead to further tissue and nerve damage.
5. Scarring is controlled by elastic wraps and bandages that apply continuous pressure to the healing skin during the time in which the skin is vulnerable to shearing.
6. Anti–burn scar support garments are usually prescribed to be worn 23 hours a day until the burn scar tissue has matured, which takes 18 to 24 months.

VI. Complex Hematological and Oncological Problems

A. Oncological emergencies: Include sepsis and disseminated intravascular coagulation (DIC), syndrome of inappropriate antidiuretic hormone (SIADH), spinal cord compression, hypercalcemia, and superior vena cava syndrome

B. Sepsis and DIC
1. Description: The client with cancer is at increased risk for infection, particularly gram-negative organisms, in the bloodstream (sepsis or septicemia) and for DIC, a life-threatening hematological problem frequently associated with sepsis.
2. Interventions
   a. Prevent the complication through early identification of clients at high risk for sepsis and DIC.
   b. Maintain strict aseptic technique with the immunocompromised client, and monitor closely for infection and signs of bleeding.
   c. Administer antibiotics intravenously as prescribed.
   d. Administer anticoagulants as prescribed during the early phase of DIC.
   e. Administer cryoprecipitated clotting factors, as prescribed, when DIC progresses and hemorrhage is the primary problem.

Notify the PHCP immediately if signs of an oncological emergency occur.

C. SIADH
1. Description
   a. SIADH occurs when there is an excess of antidiuretic hormone, which leads to impaired water excretion. The result is a high serum concentration of water, which dilutes serum sodium levels. A variety of neurological

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

conditions, including tumors that produce, secrete, or simulate substances that mimic antidiuretic hormone, may result in SIADH.
   b. Mild symptoms include weakness, muscle cramps, loss of appetite, and fatigue; serum sodium levels range from 115 to 120 mEq/L (115 to 120 mmol/L).
   c. More serious signs and symptoms relate to water intoxication and include weight gain, personality changes, confusion, and extreme muscle weakness.
   d. As the serum sodium level approaches 110 mEq/L (110 mmol/L), seizures, coma, and eventually death will occur unless the condition is treated rapidly.
2. Interventions
   a. Initiate fluid restriction and increased sodium intake as prescribed.
   b. As prescribed, administer an antagonist to antidiuretic hormone.
   c. Monitor serum sodium levels.
   d. Treat the underlying cause with chemotherapy or radiation to reduce the tumor.

D. Spinal cord compression
1. Description
   a. Spinal cord compression occurs when a tumor directly enters the spinal cord or when the vertebral column collapses from tumor entry, impinging on the spinal cord.
   b. Spinal cord compression causes back pain, usually before neurological deficits occur.
   c. Neurological deficits relate to the spinal level of compression and include numbness; tingling; loss of urethral, vaginal, and rectal sensation; and muscle weakness.
2. Interventions
   a. Early recognition: Assess for back pain and neurological deficits.
   b. Administer high-dose corticosteroids to reduce swelling around the spinal cord and relieve symptoms.
   c. Prepare the client for immediate radiation and/or chemotherapy to reduce the size of the tumor and relieve compression.
   d. Surgery may need to be performed to remove the tumor and relieve the pressure on the spinal cord.
   e. Instruct the client in the use of neck or back braces if they are prescribed.

E. Hypercalcemia
1. Description
   a. Hypercalcemia is a late manifestation of extensive malignancy that occurs most often with bone metastasis, when the bone releases calcium into the bloodstream.
   b. Decreased physical mobility contributes to or worsens hypercalcemia.
   c. Early signs include fatigue, anorexia, nausea, vomiting, constipation, and polyuria.
   d. More serious signs and symptoms include severe muscle weakness, diminished deep tendon reflexes, paralytic ileus, dehydration, and changes in the electrocardiogram.
2. Interventions
   a. Monitor serum calcium level and ECG changes.
   b. Administer oral or parenteral fluids as prescribed.
   c. Administer medications that lower the calcium level and control nausea and vomiting as prescribed.
   d. Prepare the client for dialysis if the condition becomes life-threatening or is accompanied by renal impairment.
   e. Encourage walking to prevent breakdown of bone.

F. Superior vena cava syndrome
1. Description
   a. Superior vena cava (SVC) syndrome occurs when the SVC is compressed or obstructed by tumor growth (commonly associated with lung cancer and lymphoma).
   b. Signs and symptoms result from blockage of blood flow in the venous system of the head, neck, and upper trunk.
   c. Early signs and symptoms generally occur in the morning and include edema of the face, especially around the eyes, and tightness of the shirt or blouse collar (Stokes' sign).
   d. As the condition worsens, edema in the arms and hands, dyspnea, erythema of the upper body, swelling of the veins in the chest and neck, and epistaxis occur.
   e. Life-threatening signs and symptoms include airway obstruction, hemorrhage, cyanosis, mental status changes, decreased cardiac output, and hypotension.
2. Interventions
   a. Assess for early signs and symptoms of SVC syndrome.
   b. Place the client in semi-Fowler's position and administer corticosteroids and diuretics as prescribed.
   c. Prepare the client for high-dose radiation therapy to the mediastinal area, and possible surgery to insert a metal stent in the vena cava.

G. Tumor lysis syndrome
1. Description
   a. Tumor lysis syndrome occurs when large quantities of tumor cells are destroyed rapidly and intracellular components such as potassium and uric acid are released into the bloodstream faster than the body can eliminate them.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

b. Tumor lysis syndrome can indicate that cancer treatment is destroying tumor cells; however, if left untreated, it can cause severe tissue damage and death.

c. Hyperkalemia, hyperphosphatemia with resultant hypocalcemia, and hyperuricemia occur; hyperuricemia can lead to acute kidney injury.

2. Interventions

a. Encourage oral hydration; IV hydration may be prescribed; monitor renal function and intake and output, and ensure that the client is on a renal diet low in potassium and phosphorus.

b. Administer diuretics to increase the urine flow through the kidneys as prescribed.

c. Administer medications that increase the excretion of purines, such as allopurinol, as prescribed.

d. Prepare to administer IV infusion of glucose and insulin to treat hyperkalemia.

e. Prepare the client for dialysis if hyperkalemia and hyperuricemia persist despite treatment.

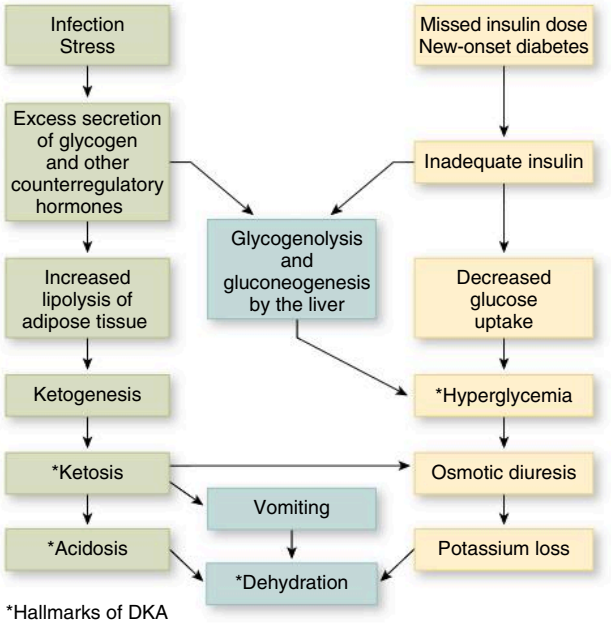

FIG. 70.18 Pathophysiology of diabetic ketoacidosis (DKA).

VII. Complex Endocrine Problems

A. Diabetic ketoacidosis (DKA)

1. Description (Fig. 70.18)

a. Diabetic ketoacidosis is a life-threatening complication of type 1 diabetes mellitus that develops when a severe insulin deficiency occurs.

b. The main clinical manifestations include hyperglycemia, dehydration, ketosis, and acidosis.

2. Assessment (Table 70.9)

3. Interventions

a. Restore circulating blood volume and protect against cerebral, coronary, and renal hypoperfusion.

b. Treat dehydration with rapid IV infusions of 0.9% or 0.45% NS as prescribed; dextrose is added to IV fluids when the blood glucose level reaches 250 to 300 mg/dL (14 to 17 mmol/L). Too rapid administration of IV fluids; use of the incorrect types of IV fluids, particularly hypotonic solutions; and correcting the blood glucose level too rapidly can lead to cerebral edema.

c. Treat hyperglycemia with insulin administered intravenously as prescribed.

d. Correct electrolyte imbalances (potassium level may be elevated as a result of dehydration and acidosis).

e. Monitor potassium level closely, because when the client receives treatment for the dehydration and acidosis, the serum potassium level will decrease and potassium replacement may be required.

f. Cardiac monitoring should be in place for the client with DKA due to risks associated with abnormal serum potassium levels.

4. Insulin IV administration

a. Use short-duration insulin only.

b. An IV bolus dose of short-duration regular U-100 insulin (usually 5 to 10 units) may be prescribed before a continuous infusion is begun.

c. The prescribed IV dose of insulin for continuous infusion is prepared in 0.9% or 0.45% NS as prescribed.

d. Always place the insulin infusion on an IV infusion controller.

e. Insulin is infused continuously until subcutaneous administration resumes, to prevent a rebound of the blood glucose level.

f. Monitor vital signs.

g. Monitor urinary output, and monitor for signs of fluid overload.

h. Monitor potassium and glucose levels and for signs of increased intracranial pressure (ICP).

i. The potassium level will fall rapidly within the first hour of treatment as the dehydration and the acidosis are treated.

j. Potassium is administered intravenously in a diluted solution as prescribed; ensure adequate renal function before administering potassium.

5. Client education (Box 70.14)

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.9 Differences Between Diabetic Ketoacidosis and Hyperosmolar Hyperglycemic Syndrome

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic Syndrome (HHS)
Onset	Sudden	Gradual
Precipitating factors	Infection	Infection
	Other stressors	Other stressors
	Inadequate insulin dose	Poor fluid intake
Manifestations	Ketosis: Kussmaul's respirations, "fruity" breath, nausea, abdominal pain	Altered central nervous system function with neurological symptoms
	Dehydration or electrolyte loss: Polyuria, polydipsia, weight loss, dry skin, sunken eyes, soft eyeballs, lethargy, coma	Dehydration or electrolyte loss: Same as for DKA
Laboratory Findings		
Serum glucose	>300 mg/dL (>17 mmol/L)	>800 mg/dL (>44.57 mmol/L)
Osmolarity	Variable	>350 mOsm/L
Serum ketones	Positive at 1:2 dilution	Negative
Serum pH	<7.35	>7.4
Serum HCO_3	<15 mEq/L (<15 mmol/L)	>20 mEq/L (>20 mmol/L)
Serum Na	Low, normal, or high	Normal or low
Serum K	Normal; elevated with acidosis, lowers following treatment	Normal or low
BUN	>20 mg/dL (>7.2 mmol/L); elevated because of dehydration	Elevated
Creatinine	>1.5 mg/dL (>132.5 mcmol/L); elevated because of dehydration	Elevated
Urine ketones	Positive	Negative

BUN, Blood urea nitrogen; *HCO_3*, bicarbonate; *K*, potassium; *Na*, sodium.
From Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 499-501.

BOX 70.14 Diabetes and Client Education: Guidelines During Illness

- Take insulin or oral antidiabetic medications as prescribed.
- Determine the blood glucose level and test the urine for ketones every 3 to 4 hours.
- If the usual meal plan cannot be followed, substitute soft foods 6 to 8 times a day.
- If vomiting, diarrhea, or fever occurs, consume liquids every 30 to 60 minutes to prevent dehydration and to provide calories.
- Notify the PHCP if vomiting, diarrhea, or fever persists; if blood glucose levels are higher than 250 to 300 mg/dL (14 to 17 mmol/L); when ketonuria is present for more than 24 hours; when unable to take food or fluids for a period of 4 hours; or when illness persists for more than 2 days.

Monitor the client being treated for DKA closely for signs of increased intracranial pressure. If the blood glucose level falls too far or too fast before the brain has time to equilibrate, water is pulled from the blood to the cerebrospinal fluid and the brain, causing cerebral edema and increased ICP.

B. Hyperosmolar hyperglycemic syndrome (HHS)

1. Description
   a. Extreme hyperglycemia occurs without ketosis or acidosis.
   b. The syndrome occurs most often in individuals with type 2 diabetes mellitus.
   c. The major difference between HHS and DKA is that ketosis and acidosis do not occur with HHS; enough insulin is present with HHS to prevent the breakdown of fats for energy, thus preventing ketosis.
2. Assessment (see Table 70.9)
3. Interventions
   a. Treatment is similar to that for DKA.
   b. Treatment includes fluid replacement, correction of electrolyte imbalances, and insulin administration.
   c. Fluid replacement in the older client must be done very carefully because of the potential for heart failure.
   d. Insulin plays a less critical role in the treatment of HHS than it does in the treatment of DKA, because ketosis and acidosis do not occur; rehydration alone may decrease glucose levels.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

VIII. Complex Gastrointestinal Problems

A. Esophageal varices

1. Description

a. Dilated and tortuous veins in the submucosa of the esophagus

b. Caused by portal hypertension, often associated with liver cirrhosis; are at high risk for rupture if portal circulation pressure rises

c. Bleeding varices are an emergency.

d. The goal of treatment is to control bleeding, prevent complications, and prevent the recurrence of bleeding.

2. Assessment

a. Hematemesis

b. Melena

c. Ascites

d. Jaundice

e. Hepatomegaly and splenomegaly

f. Dilated abdominal veins

g. Signs of shock

Rupture and resultant hemorrhage of esophageal varices are primary concerns because this would represent a life-threatening situation.

3. Interventions

a. Monitor vital signs.

b. Elevate the head of the bed.

c. Monitor for orthostatic hypotension.

d. Monitor lung sounds and for the presence of respiratory distress.

e. Administer oxygen as prescribed to prevent tissue hypoxia.

f. Monitor level of consciousness.

g. Maintain NPO status.

h. Administer fluids intravenously as prescribed to restore fluid volume and electrolyte imbalances; monitor intake and output.

i. Monitor hemoglobin and hematocrit values and coagulation factors.

j. Administer blood transfusions or clotting factors as prescribed.

k. Assist in inserting an NG tube or a balloon tamponade as prescribed; balloon tamponade is not used frequently because it is very uncomfortable for the client and its use is associated with complications.

l. Prepare to assist with administering medications to induce vasoconstriction and reduce bleeding.

m. Instruct the client to avoid activities that will initiate vasovagal responses.

n. Prepare the client for endoscopic procedures or surgical procedures as prescribed.

4. Endoscopic injection (sclerotherapy)

a. The procedure involves the injection of a sclerosing agent into and around bleeding varices.

b. Complications include chest pain, pleural effusion, aspiration pneumonia, esophageal stricture, and perforation of the esophagus.

5. Endoscopic variceal ligation

a. The procedure involves ligation of the varices with an elastic rubber band.

b. Sloughing, followed by superficial ulceration, occurs in the area of ligation within 3 to 7 days.

6. Shunting procedures

a. Description: These procedures shunt blood away from the esophageal varices.

b. Portacaval shunting involves anastomosis of the portal vein to the inferior vena cava, diverting blood from the portal system to the systemic circulation.

c. Distal splenorenal shunt: The shunt involves anastomosis of the splenic vein to the left renal vein; the spleen conducts blood from the high-pressure varices to the low-pressure renal vein.

d. Mesocaval shunting involves a side anastomosis of the superior mesenteric vein to the proximal end of the inferior vena cava.

e. Transjugular intrahepatic portosystemic shunt (TIPS): This procedure uses the normal vascular anatomy of the liver to create a shunt with the use of a metallic stent; the shunt is between the portal and systemic venous system in the liver and is aimed at relieving portal hypertension.

B. Gastrointestinal (GI) bleeding

1. Description: Bleeding that occurs at some area in the GI tract; classified into upper GI bleeding or lower GI bleeding

2. Causes of upper GI bleeding include peptic ulcer disease, stress-related erosive syndrome, esophageal or gastric varices, tearing of the GI tract, esophagitis, neoplasm, aortoenteric fistula, and angiodysplasia.

3. Causes of lower GI bleeding include diverticulosis, angiodysplasia, neoplasm, inflammatory bowel disease, trauma, infectious colitis, radiation colitis, ischemia, aortoenteric fistula, and hemorrhoids.

4. GI bleeding, or hemorrhage, is a potentially life-threatening emergency condition.

5. Assessment

a. Hematemesis

b. Hematochezia

c. Melena

d. Decreased hemoglobin and hematocrit levels (may take 24 to 72 hours for the change to occur in acute blood loss)

6. Diagnosis

a. Endoscopy once the client is hemodynamically stabilized

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.15 Chest Physiotherapy: Contraindications and Interventions

Contraindications

- Unstable vital signs
- Increased intracranial pressure
- Bronchospasm
- History of pathological fractures
- Rib fractures
- Chest incisions

Interventions

- Assess for contraindications for performing chest physiotherapy (CPT).
- Perform CPT in the morning on arising, 1 hour before meals, or 2 to 3 hours after meals.
- Stop CPT if pain occurs.
- If the client is receiving a tube feeding, stop the feeding and aspirate for residual before beginning CPT.
- Administer the bronchodilator (if prescribed) 15 minutes before the procedure.
- Place a layer of material (gown or pajamas) between the hands or percussion device and the client's skin.
- Position the client for postural drainage based on assessment.
- Percuss the area for 1 to 2 minutes.
- Vibrate the same area while the client exhales 4 or 5 deep breaths.
- Monitor for respiratory tolerance to the procedure.
- Stop the procedure if cyanosis or exhaustion occurs.
- Maintain the position for 5 to 20 minutes after the procedure.
- Repeat in all necessary positions until the client no longer expectorates mucus.
- Dispose of sputum properly.
- Provide mouth care after the procedure.

b. Tagged red blood cell scanning, angiography, or both may be used to locate the source of bleeding.

7. Interventions
   - **a.** The goal is to stop the bleeding and determine the cause of bleeding.
   - **b.** Fluid resuscitation to achieve hemodynamic stability is necessary.
   - **c.** Correction of hypercoagulability if indicated
   - **d.** Therapeutic procedures to control or stop the bleeding
   - **e.** Medications to suppress or neutralize gastric acids, including histamine-2 antagonists and proton pump inhibitors
   - **f.** Note that these medications may place the client at risk for bacterial colonization and associated infections.
   - **g.** Surgery may be used for a client who continues to be hemodynamically stable despite fluid resuscitation.

IX. Complex Respiratory Problems

A. Respiratory treatments

1. Chest physiotherapy (CPT)
   - **a.** Description: Percussion, vibration, and postural drainage techniques are performed over the thorax to loosen secretions in the affected area of the lungs and move them into more central airways.
   - **b.** Contraindications and interventions (Box 70.15)

B. Oxygen

1. Supplemental oxygen delivery systems (Table 70.10)
   - **a.** Nasal cannula for low flow: Used for the client with chronic airflow limitation and for long-term oxygen use (Fig. 70.19)
   - **b.** Nasal high-flow (NHF) respiratory therapy: Used for hypoxemic clients in mild to moderate respiratory distress (Box 70.16)
   - **c.** Simple face mask: Used for short-term oxygen therapy or to deliver oxygen in an emergency (Fig. 70.20)
   - **d.** Venturi mask: Used for clients at risk for or experiencing acute respiratory failure (Fig. 70.21)
   - **e.** Partial rebreather mask: Useful when the oxygen concentration needs to be raised; not usually prescribed for a client with chronic obstructive pulmonary disease (COPD)
   - **f.** Nonrebreather mask: Most frequently used for the client with a deteriorating respiratory status who might require intubation (Fig. 70.22)
   - **g.** Tracheostomy collar and T-bar or T-piece: Tracheostomy collar is used to deliver high humidity and the desired oxygen to the client with a tracheostomy; the T-bar or T-piece is used to deliver the desired FiO_2 to the client with a tracheostomy, laryngectomy, or endotracheal tube (Fig. 70.23).
   - **h.** Face tent: Used instead of a tight-fitting mask for the client who has facial trauma or burns

C. Noninvasive positive pressure ventilation: Continuous positive airway pressure (CPAP) and bilevel positive airway pressure (BiPAP) (Fig. 70.24)

1. Ventilatory support given without using an invasive artificial airway (endotracheal tube or tracheostomy tube); orofacial masks and nasal masks are used instead.
2. An inspiratory positive airway pressure (IPAP) and an expiratory positive airway pressure (EPAP) are set on a large ventilator or a small-flow generator ventilator with a desired pressure support and positive end-expiratory pressure (PEEP) level. This allows more air to move into and out of the lungs without the normal muscular activity needed to do so.
3. CPAP maintains a set positive airway pressure during inspiration and expiration; beneficial in clients who have obstructive sleep apnea or acute exacerbations of COPD.

TABLE 70.10 Supplemental Oxygen Delivery Systems

Device	Oxygen Delivered	Nursing Considerations
Nasal cannula (nasal prongs) (see Fig. 70.19)	▪ 1-6 L/min for oxygen concentration (FiO_2) of 24% (at 1 L/min) to 44% (at 6 L/min)	▪ Easily tolerated ▪ Can dislodge easily. Does not get in the way of eating or talking. ▪ Effective oxygen concentration can be delivered. Allows the client to breathe through the nose or mouth. ▪ Ensure that prongs are in the nares with openings facing the client. ▪ Assess nasal mucosa for irritation from drying effect of higher flow rates. ▪ Assess skin integrity, as tubing can irritate skin. ▪ Add humidification as prescribed, and check water levels.
Simple face mask (see Fig. 70.20)	▪ 5-8 L/min oxygen flow for FiO_2 of 40%-60% ▪ Minimum flow of 5 L/min needed to flush CO_2 from mask	▪ Interferes with eating and talking. ▪ Can be warm and confining. ▪ Ensure that mask fits securely over nose and mouth. ▪ Remove saliva and mucus from the mask. ▪ Provide skin care to area covered by mask. ▪ Provide emotional support to decrease anxiety in the client who feels claustrophobic. ▪ Monitor for risk of aspiration from inability of client to clear mouth (i.e., if vomiting occurs).
Venturi mask (Venti-mask) (see Fig. 70.21)	▪ 4-10 L/min oxygen flow for FiO_2 of 24%-55% ▪ Delivers exact desired selected concentrations of O_2	▪ Keep the air entrapment port for the adapter open and uncovered to ensure adequate oxygen delivery. ▪ Keep mask snug on the face, and ensure that tubing is free of kinks, because the FiO_2 is altered if kinking occurs or if the mask fits poorly. ▪ Assess nasal mucosa for irritation; humidity or aerosol can be added to the system as needed.
Partial rebreather mask (mask with reservoir bag)	▪ 6-15 L/min oxygen flow for FiO_2 of 70%-90%	▪ The client rebreathes one-third of the exhaled tidal volume, which is high in oxygen, thus providing a high FiO_2. ▪ Adjust flow rate to keep the reservoir bag two-thirds full during inspiration. ▪ Keep mask snug on face. ▪ Make sure the reservoir bag does not twist or kink. ▪ Deflation of the bag results in decreased oxygen delivered and rebreathing of exhaled air.
Nonrebreather mask (see Fig. 70.22)	▪ FiO_2 of 60%-100% at a rate of flow that maintains the bag two-thirds full	▪ Adjust flow rate to keep the reservoir bag inflated. ▪ Remove mucus and saliva from the mask. ▪ Provide emotional support to decrease anxiety in the client who feels claustrophobic. ▪ Ensure that the valves and flaps are intact and functional during each breath (valves should open during expiration and close during inhalation). ▪ Make sure the reservoir bag does not twist or kink or that the oxygen source does not disconnect; otherwise, the client will suffocate.
Tracheostomy collar and T-bar or T-piece, endotracheal tube (face tent; face shield) (see Fig. 70.23)	▪ The tracheostomy collar can be used to deliver the desired amount of oxygen to a client with a tracheostomy. ▪ A special adapter (T-bar or T-piece) can be used to deliver any desired FiO_2 to client with tracheostomy, laryngectomy, or endotracheal tube. ▪ The face tent provides 8-12 L/min and the FiO_2 varies due to environmental loss.	▪ Ensure that aerosol mist escapes from the vents of the delivery system during inspiration and expiration. ▪ Empty condensation from the tubing to prevent the client from being lavaged with water and to promote an adequate oxygen flow rate (remove and clean the tubing at least every 4 hr). ▪ Keep the exhalation port in the T-piece open and uncovered (if the port is occluded, the client can suffocate). ▪ Position the T-piece so that it does not pull on the tracheostomy or endotracheal tube and cause erosion of the skin at the tracheostomy insertion site.

4. BiPAP provides positive airway pressure during inspiration and ceases airway support during expiration; there is only enough pressure provided during expiration to keep the airways open; usually used if CPAP is ineffective.
5. Both CPAP and BiPAP improve oxygenation through airway support.
6. Can be used in certain situations of COPD distress, heart failure, asthma, pulmonary edema, and hypercapnic respiratory failure.
7. General interventions
   a. Assess color, pulse oximetry reading, and vital signs before and during treatment.
   b. Place an *Oxygen in Use* sign at the client's bedside.
   c. Assess for the presence of chronic lung problems.
   d. Humidify the oxygen if indicated.
   e. For specific considerations for each supplemental oxygen delivery system, see Table 70.10.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

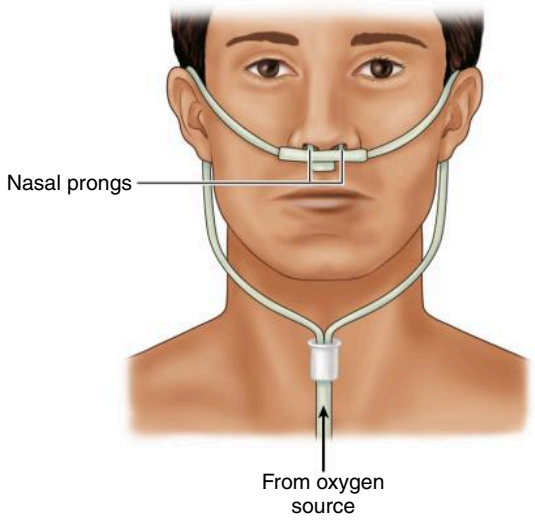

FIG. 70.19 A nasal cannula (prongs).

BOX 70.16 Nasal High-Flow (NHF) Respiratory Therapy

- Comfortably delivers high flows of heated and humidified oxygen through a wide-bore nasal cannula and humidification system
- Can deliver nasal flow rates up to 50 to 60 L/minute to deliver humidified high-flow oxygen therapy

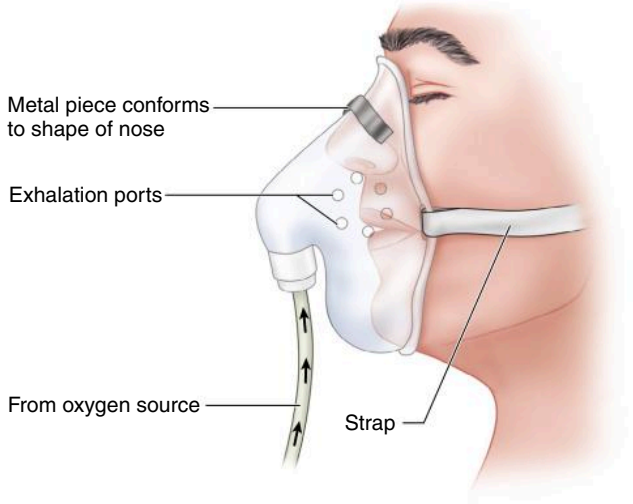

FIG. 70.20 A simple face mask used to deliver oxygen.

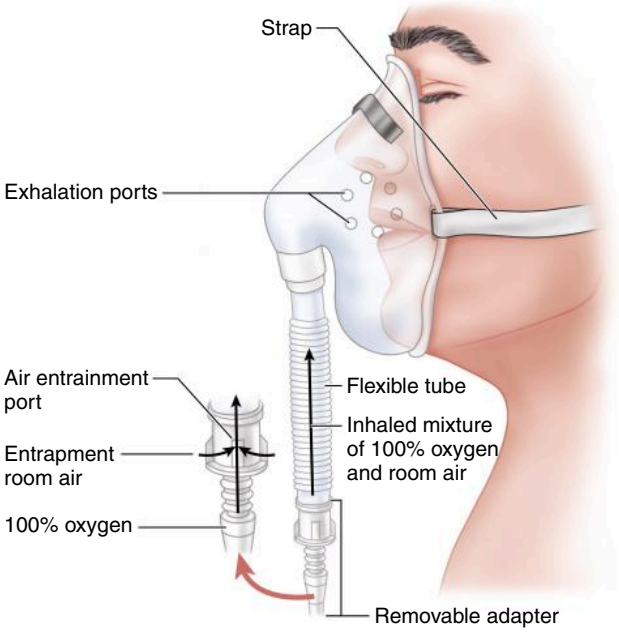

FIG. 70.21 A Venturi mask for precise oxygen delivery.

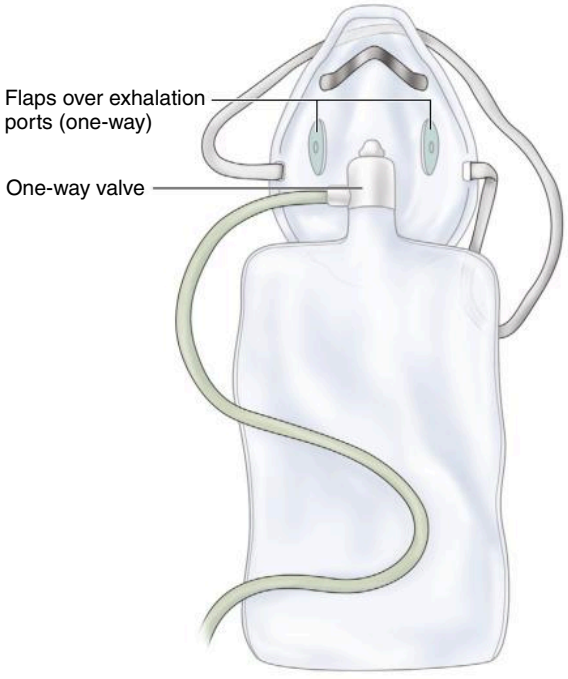

FIG. 70.22 A nonrebreather mask.

⚠ A client who is hypoxemic and has chronic hypercapnia may require low levels of oxygen delivery at 1 to 2 L/minute, because a low arterial oxygen level is the client's primary drive for breathing; always check the PHCP's prescriptions.

D. Mechanical ventilation

1. Types include pressure-cycled ventilator, time-cycled ventilator, volume-cycled ventilator, and microprocessor ventilator.
2. Pressure-cycled ventilator: The ventilator pushes air into the lungs until a specific airway pressure is reached; it is used for short periods, as in the postanesthesia care unit.
3. Time-cycled ventilator: The ventilator pushes air into the lungs until a preset time has elapsed; it is used for the pediatric or neonatal client.
4. Volume-cycled ventilator
   a. The ventilator pushes air into the lungs until a preset volume is delivered.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

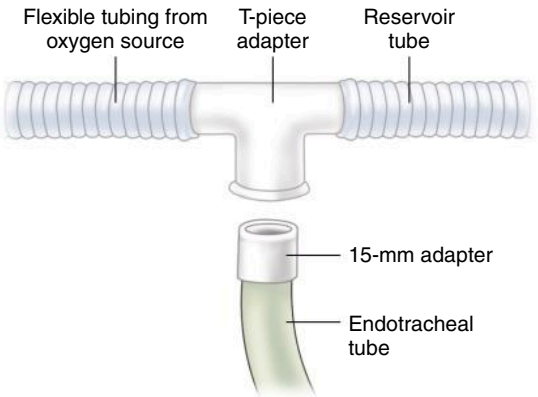

FIG. 70.23 A T-piece apparatus for attachment to an endotracheal tube or tracheostomy tube.

FIG. 70.24 A BiPAP (bilevel positive airway pressure) system using a nasal mask for pressure- and volume-controlled ventilation.

   b. A constant tidal volume is delivered regardless of the changing compliance of the lungs and chest wall or the airway resistance in the client or ventilator.

5. Microprocessor ventilator
   a. A computer or microprocessor is built into the ventilator to allow continuous monitoring of ventilatory functions, alarms, and client parameters.
   b. This type of ventilator is more responsive to clients who have severe lung disease or require prolonged weaning.

E. Modes of mechanical ventilation: Invasive modes include controlled, assist-controlled, and synchronized intermittent mandatory ventilation (SIMV).

⚠ A bag-valve resuscitation mask should be available at the bedside for all clients receiving mechanical ventilation.

1. Controlled
   a. The client receives a set tidal volume at a set rate.
   b. Used for clients who cannot initiate respiratory effort
   c. Least used mode; if the client attempts to initiate a breath, the ventilator locks out the client's inspiratory effort.
2. Assist-control
   a. Tidal volume and ventilatory rate are preset on the ventilator.
   b. The ventilator takes over the work of breathing for the client.
   c. The ventilator is programmed to respond to the client's inspiratory effort if the client does initiate a breath.
   d. The ventilator delivers the preset tidal volume when the client initiates a breath while allowing the client to control the rate of breathing.
   e. If the client's spontaneous ventilatory rate increases, the ventilator continues to deliver a preset tidal volume with each breath, which may cause hyperventilation and respiratory alkalosis.
3. SIMV
   a. Similar to assist-control ventilation in that the tidal volume and ventilatory rate are preset on the ventilator
   b. Allows clients to breathe spontaneously at their own rate and tidal volume between the ventilator breaths
   c. Can be used as a primary ventilatory mode or as a weaning mode
   d. When SIMV is used as a weaning mode, the number of SIMV breaths is decreased gradually, and the client gradually resumes spontaneous breathing.

F. Ventilator controls and settings (Table 70.11)

G. Mechanical ventilation: Interventions

⚠ For a client receiving mechanical ventilation, always assess the client first and then assess the ventilator.

1. Assess vital signs, lung sounds, respiratory status, and breathing patterns (the client will never breathe at a rate lower than the rate set on the ventilator).
2. Monitor skin color, particularly in the lips and nail beds.
3. Monitor the chest for bilateral expansion.
4. Obtain pulse oximetry readings.
5. Monitor ABG results.
6. Assess the need for suctioning and observe the type, color, and amount of secretions.
7. Assess ventilator settings.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

TABLE 70.11 Ventilator Controls and Settings and Descriptions

Controls and Settings	Descriptions
Tidal volume	The volume of air that the client receives with each breath
Rate	The number of ventilator breaths delivered per minute
Sighs	The volumes of air that are 1.5-2 times the set tidal volume, delivered 6-10 times per hour; may be used to prevent atelectasis
Fraction of inspired oxygen (FiO_2)	The oxygen concentration delivered to the client; determined by the client's condition and ABG levels
Peak airway inspiratory pressure	The pressure needed by the ventilator to deliver a set tidal volume at a given compliance Monitoring peak airway inspiratory pressure reflects changes in compliance of the lungs and resistance in the ventilator or client.
Continuous positive airway pressure	The application of positive airway pressure throughout the entire respiratory cycle for spontaneously breathing clients Keeps the alveoli open during inspiration and prevents alveolar collapse; used primarily as a weaning modality No ventilator breaths are delivered, but the ventilator delivers oxygen and provides monitoring and an alarm system; the respiratory pattern is determined by the client's efforts.
Positive end-expiratory pressure (PEEP)	Positive pressure is exerted during the expiratory phase of ventilation, which improves oxygenation by enhancing gas exchange and preventing atelectasis. The need for PEEP indicates a severe gas exchange disturbance. Higher levels of PEEP (more than 15 cm H_2O) increase the chance of complications, such as barotrauma tension pneumothorax.
Pressure support	The application of positive pressure on inspiration that eases the workload of breathing. May be used in combination with PEEP as a weaning method. As the weaning process continues, the amount of pressure applied to inspiration is gradually decreased.

ABG, Arterial blood gas.

8. Assess the level of water in the humidifier and the temperature of the humidification system, because extremes in temperature can damage the mucosa in the airway.
9. Ensure that the alarms are set.
10. If a cause for an alarm cannot be determined, ventilate the client manually with a bag-valve resuscitation mask until the problem is corrected.
11. Empty the ventilator tubing when moisture collects.
12. Turn the client at least every 2 hours or get the client out of bed, as prescribed, to prevent complications of immobility.
13. Have resuscitation equipment available at the bedside.

H. Causes of ventilator alarms (Box 70.17)

I. Alarm safety and alarm fatigue

1. It is the responsibility of the nurse to be alert to the sound of an alarm, because this signals a client problem.
2. The nurse needs to respond promptly to an alarm and immediately assess the client.
3. According to The Joint Commission (TJC), the most common contributing factor related to alarm-related sentinel events is alarm fatigue, which results when numerous alarms and the resulting noise tend to desensitize the nursing staff and cause them to ignore alarms or even disable them.
4. Some recommendations of TJC include establishing alarm safety as a facility policy, identifying default alarm settings, identifying the most important alarms to manage, establishing policies and procedures for managing alarms, and staff education.

BOX 70.17 Causes of Ventilator Alarms

Collaborate with respiratory therapy in troubleshooting and addressing ventilator alarms.

High-Pressure Alarm

- Increased secretions are in the artificial airway or the client's own airway.
- Wheezing or bronchospasm is causing decreased airway size.
- The endotracheal tube is displaced.
- The ventilator tube is obstructed because of water or a kink in the tubing.
- Client coughs, gags, or bites on the oral endotracheal tube.
- Client is anxious or fights the ventilator.

Low-Pressure Alarm

- Disconnection or leak in the ventilator or in the client's airway cuff occurs.
- The client stops spontaneous breathing.

Never set ventilator alarm controls to the off position.

J. Complications of mechanical ventilation

1. Hypotension caused by the application of positive pressure, which increases intrathoracic pressure and inhibits blood return to the heart
2. Respiratory complications such as pneumothorax or subcutaneous **emphysema** as a result of positive pressure
3. Gastrointestinal alterations such as stress ulcers

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

4. Malnutrition if nutrition is not maintained
5. Infections
6. Muscular deconditioning
7. Ventilator dependence or inability to wean
8. Bradycardia as a result of increased intrathoracic pressure or activated vagal response

K. Weaning: Process of going from ventilator dependence to spontaneous breathing; methods include SIMV, T-piece, and pressure support.

1. SIMV
   a. The client breathes between the preset breaths per minute rate of the ventilator.
   b. The SIMV rate is decreased gradually until the client is breathing without the use of the ventilator.
2. T-piece
   a. The client is taken off the ventilator and the ventilator is replaced with a T-piece or CPAP, which delivers humidified oxygen.
   b. The client is taken off the ventilator for short periods initially and allowed to breathe spontaneously.
   c. Weaning progresses as the client is able to tolerate progressively longer periods off the ventilator.
3. Pressure support
   a. Pressure support is a predetermined pressure set on the ventilator to assist the client in respiratory effort during inspiration.
   b. As weaning continues, the amount of pressure is decreased gradually.
   c. With pressure support, pressure may be maintained while the preset breaths per minute of the ventilator are decreased gradually.

L. Rib fracture

1. Results from direct blunt chest trauma and causes a potential for intrathoracic injury, such as pneumothorax, hemothorax, or pulmonary contusion
2. Pain with movement, deep breathing, and coughing results in impaired ventilation and inadequate clearance of secretions.
3. Assessment
   a. Pain and tenderness at the injury site that increases with inspiration
   b. Shallow respirations
   c. Client splints chest
   d. Fractures noted on chest x-ray
4. Interventions
   a. Note that the ribs usually reunite spontaneously.
   b. Place the client in a Fowler's position.
   c. Administer pain medication as prescribed to maintain adequate ventilatory status.
   d. Monitor for increased respiratory distress.
   e. Instruct the client to self-splint with the hands, arms, or a pillow.
   f. Open reduction and internal fixation of the ribs (rib plating) may be done in some cases, as in the case of more than five rib fractures with a flail segment, particularly when requiring mechanical ventilation, or when otherwise deemed appropriate by the trauma team.
   g. Prepare the client for an intercostal nerve block as prescribed if the pain is severe.

M. Flail chest

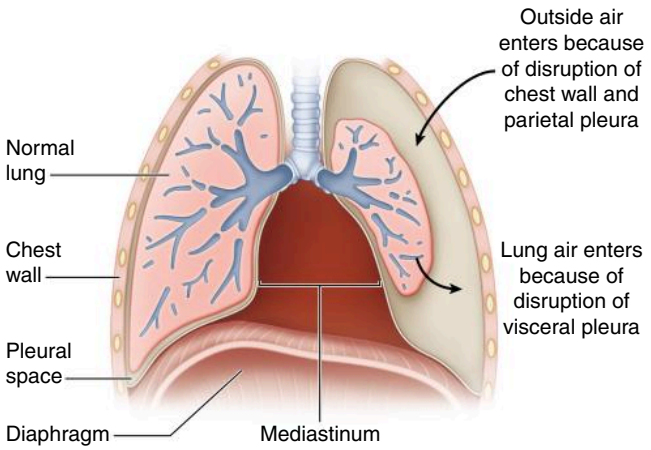
1. Occurs from blunt chest trauma associated with accidents, which may result in hemothorax and rib fractures
2. The loose segment of the chest wall becomes paradoxical to the expansion and contraction of the rest of the chest wall.
3. Assessment
   a. Paradoxical respirations (inward movement of a segment of the thorax during inspiration with outward movement during expiration)
   b. Severe pain in the chest
   c. Dyspnea
   d. Cyanosis
   e. Tachycardia
   f. Hypotension
   g. Tachypnea, shallow respirations
   h. Diminished breath sounds
4. Interventions
   a. Maintain the client in a Fowler's position.
   b. Administer oxygen as prescribed.
   c. Monitor for increased respiratory distress.
   d. Encourage coughing and deep breathing.
   e. Administer pain medication as prescribed.
   f. Maintain bed rest and limit activity to reduce oxygen demands.
   g. Open reduction and internal fixation of the ribs (rib plating) may be done.
   h. Prepare for intubation with mechanical ventilation, with PEEP for severe flail chest associated with respiratory failure and shock.

N. Pulmonary contusion

1. Characterized by interstitial hemorrhage associated with intra-alveolar hemorrhage, resulting in decreased pulmonary compliance
2. The major complication is acute respiratory distress syndrome.
3. Assessment
   a. Dyspnea
   b. Restlessness
   c. Increased bronchial secretions
   d. Hypoxemia
   e. Hemoptysis
   f. Decreased breath sounds
   g. Crackles and wheezes
4. Interventions
   a. Maintain a patent airway and adequate ventilation.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu



Outside air enters because of disruption of chest wall and parietal pleura
Normal lung
Chest wall
Lung air enters because of disruption of visceral pleura
Pleural space
Diaphragm
Mediastinum

FIG. 70.25 Pneumothorax. Air in the pleural space causes the lungs to collapse around the hilus and may push the mediastinal contents (heart and great vessels) toward the other lung.

BOX 70.18 Assessment Findings: Pneumothorax

- Absent or markedly decreased breath sounds on affected side
- Cyanosis
- Decreased chest expansion unilaterally
- Dyspnea
- Hypotension
- Sharp chest pain
- Subcutaneous emphysema as evidenced by crepitus on palpation
- Sucking sound with open chest wound
- Tachycardia
- Tachypnea
- Tracheal deviation to the unaffected side with tension pneumothorax

b. Place the client in a Fowler's position.
c. Administer oxygen as prescribed.
d. Monitor for increased respiratory distress.
e. Maintain bed rest and limit activity to reduce oxygen demands.
f. Prepare for mechanical ventilation with PEEP if required.

O. Pneumothorax (Fig. 70.25)

1. Accumulation of atmospheric air in the pleural space, which results in a rise in intrathoracic pressure and reduced vital capacity
2. The loss of negative intrapleural pressure results in collapse of the lung.
3. A spontaneous pneumothorax occurs with the rupture of a pulmonary bleb, or small air-containing spaces deep in the lung.
4. An open pneumothorax occurs when an opening through the chest wall allows the entrance of positive atmospheric air pressure into the pleural space.
5. A tension pneumothorax occurs from a blunt chest injury or from mechanical ventilation with PEEP when a buildup of positive pressure occurs in the pleural space.
6. Assessment (Box 70.18)
7. Interventions
   a. Diagnosis of pneumothorax is made by chest x-ray.
   b. Apply a sterile nonporous three-sided occlusive dressing over an open (sucking) chest wound.
   c. Administer oxygen as prescribed.
   d. Place the client in a Fowler's position.
   e. Prepare for chest tube placement, which will remain in place until the lung has expanded fully (see Section IV, O, for information on chest tubes).
   f. Monitor the chest tube drainage system.
   g. Monitor for subcutaneous emphysema.

⚠ Clients with a respiratory disorder should be positioned with the head of the bed elevated.

P. Acute respiratory failure

1. Occurs when insufficient oxygen is transported to the blood or inadequate carbon dioxide is removed from the lungs and the client's compensatory mechanisms fail
2. Causes include a mechanical abnormality of the lungs or chest wall, a defect in the respiratory control center in the brain, or an impairment in the function of the respiratory muscles.
3. In oxygenation failure, or hypoxemic respiratory failure, oxygen may reach the alveoli but cannot be absorbed or used properly, resulting in a PaO_2 lower than 60 mm Hg, arterial oxygen saturation (SaO_2) lower than 90%, or partial pressure of arterial carbon dioxide ($PaCO_2$) greater than 50 mm Hg occurring with acidemia.
4. Respiratory failure can be hypoxemic, hypercapnic, or both. Inadequate gas exchange is the mechanism behind failure. Arterial oxygen, carbon dioxide, or both are not kept at normal levels, resulting in failure.
5. Many clients experience both hypoxemic and hypercapnic respiratory failure; retained carbon dioxide in the alveoli displaces oxygen, contributing to the hypoxemia.
6. Manifestations of respiratory failure are related to the extent and rapidity of change in PaO_2 and $PaCO_2$.
7. Assessment
   a. Dyspnea
   b. Restlessness
   c. Confusion
   d. Tachycardia
   e. Hypertension

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

f. Dysrhythmias
g. Decreased level of consciousness
h. Alterations in respirations and breath sounds
i. Headache (less common)

8. Interventions
   a. Identify and treat the cause of the respiratory failure.
   b. Administer oxygen to maintain the PaO_2 level higher than 60 to 70 mm Hg.
   c. Place the client in a Fowler's position.
   d. Encourage deep breathing.
   e. Administer bronchodilators as prescribed.
   f. Prepare the client for mechanical ventilation if supplemental oxygen cannot maintain acceptable PaO_2 and $PaCO_2$ levels.

Q. Acute respiratory distress syndrome

1. A form of acute respiratory failure that occurs as a complication caused by a diffuse lung injury or critical illness and leads to extravascular lung fluid
2. The major site of injury is the alveolar capillary membrane.
3. The interstitial edema causes compression and obliteration of the terminal airways and leads to reduced lung volume and compliance.
4. The ABG levels identify respiratory acidosis and hypoxemia that do not respond to an increased percentage of oxygen.
5. The chest x-ray shows bilateral interstitial and alveolar infiltrates; interstitial edema may not be noted until there is a 30% increase in fluid content.
6. Causes include sepsis, fluid overload, shock, trauma, neurological injuries, burns, DIC, drug ingestion, aspiration, and inhalation of toxic substances.
7. Assessment
   a. Tachypnea (earliest sign, can begin from 1 to 96 hr after initial insult)
   b. Dyspnea
   c. Decreased breath sounds
   d. Deteriorating ABG levels
   e. Hypoxemia despite high concentrations of delivered oxygen
   f. Decreased pulmonary compliance
   g. Pulmonary infiltrates
8. Interventions
   a. Identify and treat the cause of the acute respiratory distress syndrome.
   b. Administer oxygen as prescribed.
   c. Place the client in a Fowler's position.
   d. Restrict fluid intake as prescribed.
   e. Provide respiratory treatments as prescribed.
   f. Administer diuretics, anticoagulants, or corticosteroids as prescribed.
   g. Prepare the client for intubation and mechanical ventilation using PEEP.

X. Complex Cardiovascular Problems

A. Cardiogenic shock

1. Cardiogenic shock is failure of the heart to pump adequately, thereby reducing cardiac output and compromising tissue perfusion.
2. Necrosis of more than 40% of the left ventricle, usually as a result of occlusion of major coronary vessels, leads to cardiogenic shock.
3. The goal of treatment is to maintain tissue oxygenation and perfusion and improve the pumping ability of the heart.
4. Assessment
   a. Hypotension: BP lower than 90 mm Hg systolic or 30 mm Hg lower than the client's baseline
   b. Urine output lower than 30 mL/hr
   c. Cold, clammy skin
   d. Poor peripheral pulses
   e. Tachycardia, tachypnea
   f. Pulmonary congestion
   g. Disorientation, restlessness, and confusion
   h. Continuing chest discomfort
5. Interventions
   a. Administer oxygen as prescribed.
   b. Administer morphine sulfate intravenously as prescribed to decrease pulmonary congestion and relieve chest pain.
   c. Prepare for intubation and mechanical ventilation.
   d. Administer diuretics and nitrates as prescribed while monitoring the BP constantly.
   e. Administer vasopressors and positive inotropes as prescribed to maintain organ perfusion.
   f. Prepare the client for insertion of an intraaortic balloon pump, if prescribed, to improve coronary artery perfusion and improve cardiac output.
   g. Prepare the client for immediate reperfusion procedures such as percutaneous transluminal coronary angioplasty (PTCA) or coronary artery bypass graft.
   h. Monitor arterial blood gas levels and prepare to treat imbalances.
   i. Monitor urinary output.
   j. Assist with the insertion of a pulmonary artery (Swan-Ganz) catheter to assess degree of heart failure (Fig. 70.26).

B. Hemodynamic monitoring: Includes central venous pressure (CVP), pulmonary artery pressures, and mean arterial pressure (MAP) (see Fig. 70.26)

C. Central venous pressure (CVP)

1. The CVP is the pressure within the superior vena cava; it reflects the pressure under which blood is returned to the superior vena cava and right atrium.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

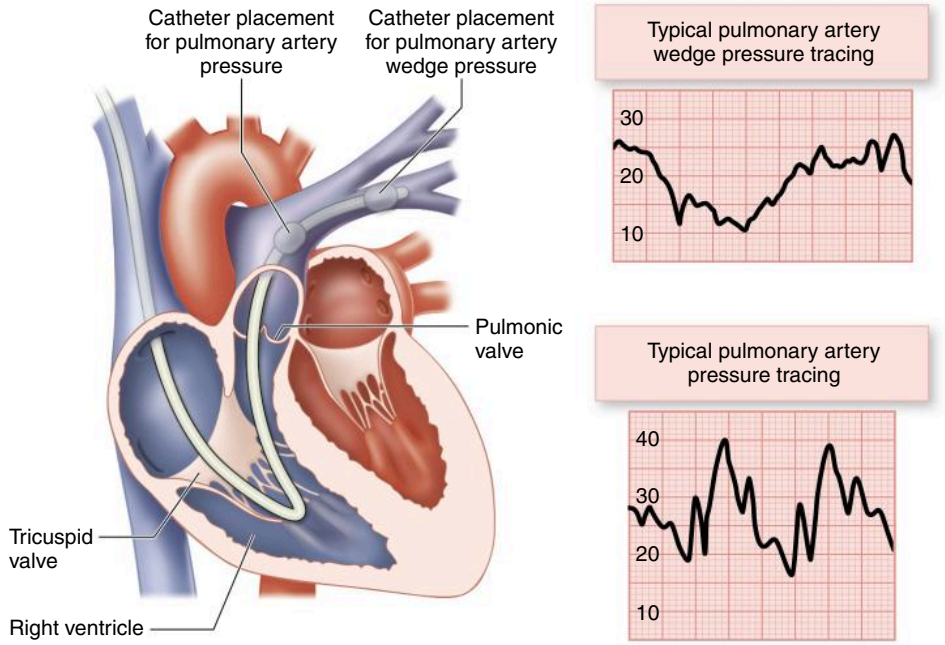


FIG. 70.26 Cardiac pressure waveforms can be visualized on the monitor.

2. The CVP is measured with a central venous line in the superior vena cava.
3. Normal CVP pressure ranges between approximately 3 to 8 mm Hg.
4. An elevated CVP indicates an increase in blood volume as a result of sodium and water retention, excessive IV fluids, alterations in fluid balance, or kidney failure.
5. A decreased CVP indicates a decrease in circulating blood volume and may be a result of fluid imbalances, hemorrhage, or severe vasodilation, with pooling of blood in the extremities that limits venous return.
6. CVP measurement is susceptible to positioning of the client/bed/transducer and should be used to monitor trends and not used for a one-time measurement.

D. Measuring CVP

1. The right atrium is located at the midaxillary line at the fourth intercostal space; the zero point on the transducer needs to be at the level of the right atrium.
2. The client needs to be relaxed; activity that increases intrathoracic pressure, such as coughing or straining, will cause false increases in the readings.
3. If the client is on a ventilator, the reading should be taken at the point of end-expiration since positive pressure ventilation systems will increase CVP readings falsely.
4. To maintain patency of the central venous line, a continuous small amount of fluid is delivered under pressure.

E. Pulmonary artery pressures

1. A pulmonary artery catheter is used to measure right heart and indirect left heart pressures.
2. **Pulmonary artery wedge pressure (PAWP)** is also known as pulmonary artery occlusive pressure (PAOP) and as pulmonary capillary wedge pressure (PCWP).
3. The measurement is obtained during momentary balloon inflation of the pulmonary artery catheter and reflects left ventricular end-diastolic pressure.
4. PAWP normally ranges between approximately 4 and 12 mm Hg; elevations may indicate left ventricular failure, hypervolemia, mitral regurgitation, or intracardiac shunt, whereas decreases may indicate hypovolemia or afterload reduction.
5. Normal RA pressure ranges between approximately 2 and 6 mm Hg; increases occur with right ventricular failure, whereas decreases may indicate hypovolemia.
6. Normal pulmonary artery pressure (PAP) ranges from approximately 15 to 30 mm Hg systolic/8 to 15 mm Hg diastolic.
7. Monitoring of various waveforms is required; if a waveform appears to have a PAWP appearance without a wedge procedure being performed, the location of the catheter needs to be assessed and repositioned to prevent harm to the client.

F. **Mean arterial pressure (MAP)**

1. An approximation of the average pressure in the systemic circulation throughout the cardiac cycle
2. MAP ranges from approximately 70 to 105 mm Hg.

G. Guidelines for performing adult CPR: Refer to American Heart Association (2020). *Highlights of the 2020 American Heart Association Guidelines for CPR and ECC.* p. 11 at https://cpr.heart.org/-/media/cpr-files/cpr-guidelines-files/highlights/hghlghts_2020_ecc_guidelines_english.pdf

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

H. Advanced management of pulseless rhythms
   1. Initial steps
      a. Begin CPR; attach the monitor or defibrillator.
      b. Determine whether the rhythm is shockable or nonshockable.
      c. Shockable pulseless rhythms include ventricular fibrillation and ventricular tachycardia.
      d. Nonshockable pulseless rhythms include asystole and pulseless electrical activity (PEA).
   2. Shockable rhythms: Ventricular fibrillation and ventricular tachycardia
      a. After beginning CPR, attaching the monitor, and determining the rhythm, shock at 100 to 200 J as an initial dose that is increased if biphasic; use 360 J if monophasic.
      b. Continue CPR and establish an IV or intraosseous (IO) access if not previously done.
      c. Analyze the rhythm; if shockable, shock again.
      d. Prepare to administer epinephrine 1 mg every 3 to 5 minutes as prescribed.
      e. An advanced airway should be considered, and capnography should be used to determine CPR quality.
      f. Continue CPR, analyze the rhythm, and shock if the rhythm is shockable. If the rhythm becomes unshockable, follow the nonshockable rhythms approach.
      g. As prescribed, prepare to administer amiodarone 300 mg IV/IO bolus, followed by 150 mg IV/IO if indicated at the next appropriate cycle.
      h. Consider reversible causes, which include hypoxia, hypovolemia, hydrogen ions or acidosis, hyperkalemia, or hypokalemia (5 Hs), and tension pneumothorax, tamponade, toxins, thrombosis (pulmonary embolus), or thrombosis (acute coronary syndrome; 5 Ts).
      i. Continue to cycle through the above steps until return of spontaneous circulation (ROSC) or until CPR efforts are ceased.
   3. Nonshockable rhythms: Asystole and PEA
      a. After beginning CPR, attaching the monitor, and determining the rhythm, establish an IV or IO access if not previously done.
      b. Prepare to administer epinephrine 1 mg every 3 to 5 minutes as prescribed.
      c. An advanced airway should be considered, and capnography should be used to determine CPR quality.
      d. Continue CPR, analyze the rhythm, and follow the shockable rhythm approach if the rhythm becomes shockable.
      e. Consider reversible causes, which include hypoxia, hypovolemia, hydrogen ions or acidosis, hyperkalemia, or hypokalemia (5 Hs), and tension pneumothorax, tamponade, toxins, thrombosis (pulmonary embolus), or thrombosis (acute coronary syndrome; 5 Ts).
      f. Continue to cycle through the above steps until return of spontaneous circulation (ROSC) or until CPR efforts are ceased.
   4. Post–cardiac arrest care
      a. If ROSC is achieved, advanced airway placement should be done if not previously established, oxygen saturation should be maintained greater than 94%, and hyperventilation should be avoided.
      b. If hypotension is present (systolic blood pressure less than 90 mm Hg), vasopressors and IV fluid boluses are needed.
      c. IV fluids include 1 to 2 liters of normal saline or lactated Ringer's solution.
      d. Vasopressors include epinephrine IV infusion 0.1 to 0.5 mg/kg/minute, dopamine IV infusion 5 to 10 mcg/kg/minute, or norepinephrine 0.1 to 0.5 mcg/kg/minute.
      e. A 12-lead electrocardiogram should be done.
      f. If the client is following commands, consider targeted temperature management to preserve neurological function; IV fluids cooled to 4° C should be used.
      g. If ST-elevation myocardial infarction (STEMI) or other form of acute MI is suspected, coronary reperfusion should be done, and the client should be managed on the critical care unit.
   5. Post–Cardiac Arrest Care Guidelines: Adapted from the American Heart Association. (2018). *Part 7: Advanced cardiovascular life support.* Retrieved from https://www.aclsmedicaltraining.com/adult-post-cardiac-arrest-care-algorithm/ and American Heart Association. (2020). *Highlights of the 2020 American Heart Association Guidelines for CPR and ECC.* p. 11 at https://cpr.heart.org/-/media/cpr-files/cpr-guidelines-files/highlights/hghlghts_2020_ecc_guidelines_english.pdf.

I. Cardiac tamponade
   1. A pericardial effusion occurs when the space between the parietal and visceral layers of the pericardium fills with fluid.
   2. Pericardial effusion places the client at risk for cardiac tamponade, an accumulation of fluid in the pericardial cavity.
   3. Tamponade restricts ventricular filling, and cardiac output drops.

⚠ Acute cardiac tamponade can occur when small volumes (20 to 50 mL) of fluid accumulate rapidly in the pericardium.

   4. Assessment
      a. Pulsus paradoxus
      b. Increased CVP
      c. Jugular venous distention with clear lungs

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

d. Distant, muffled heart sounds
e. Decreased cardiac output
f. Narrowing pulse pressure

5. Interventions
a. The client needs to be placed in a critical care unit for hemodynamic monitoring.
b. Administer fluids intravenously as prescribed to manage decreased cardiac output.
c. Prepare the client for chest x-ray or echocardiography.
d. Prepare the client for pericardiocentesis to withdraw pericardial fluid if prescribed.
e. Monitor for recurrence of tamponade following pericardiocentesis.
f. If the client experiences recurrent tamponade or recurrent effusions or develops adhesions from chronic pericarditis, a portion (pericardial window) or all of the pericardium (pericardiectomy) may be removed to allow adequate ventricular filling and contraction.

J. Coronary artery bypass grafting
1. The occluded coronary arteries are bypassed with the client's own venous or arterial blood vessels.
2. The saphenous vein, internal mammary artery, or other arteries may be used to bypass lesions in the coronary arteries.
3. Coronary artery bypass grafting is performed when the client does not respond to medical management of coronary artery disease or when vessels are severely occluded.
4. A minimally invasive direct coronary artery bypass (MIDCAB) may be an option for some clients who have a lesion in the LAD artery; a sternal incision is not required (usually a 2-inch [5 cm] left thoracotomy incision is done), and cardiopulmonary bypass is not required in this procedure.
5. Preoperative interventions
a. Familiarize the client and family with the cardiac surgical critical care unit.
b. Inform the client to expect a sternal incision, possible arm or leg incision(s), one or two chest tubes, a Foley catheter, and several IV fluid catheters.
c. Inform the client that an endotracheal tube will be in place for a short period and that they will be unable to speak.
d. Advise the client that they will be on mechanical ventilation and to breathe with the ventilator and not fight it.
e. Instruct the client that postoperative pain is expected and that pain medication will be available.
f. Instruct the client in how to splint the chest incision, cough and deep-breathe, use the incentive spirometer, and perform arm and leg exercises.
g. Encourage the client and family to discuss anxieties and fears related to surgery.
h. Note that prescribed medications may be discontinued preoperatively (usually, diuretics 2 to 3 days before surgery, digoxin 12 hours before surgery, and aspirin and anticoagulants 1 week before surgery).
i. Administer medications as prescribed, which may include potassium chloride, antihypertensives, antidysrhythmics, and antibiotics.

6. Cardiac surgical unit postoperative interventions
a. Mechanical ventilation is maintained for 6 to 24 hours as prescribed.
b. The heart rate and rhythm, pulmonary artery and arterial pressures, urinary output, and neurological status are monitored closely.
c. Mediastinal and pleural chest tubes to the water seal drainage system with prescribed suction are present; drainage exceeding 100 to 150 mL/hr is reported to the surgeon.
d. Epicardial pacing wires are covered with sterile caps or connected to a temporary pacemaker generator; all equipment in use must be properly grounded to prevent microshock.
e. Fluid and electrolyte balance is monitored closely; fluids are usually restricted to 1500 to 2000 mL because the client usually has edema.
f. The blood pressure is monitored closely, because hypotension can cause collapse of a vein graft; hypertension can cause increased pressure, promoting leakage from the suture line, causing bleeding.
g. Temperature is monitored, and rewarming procedures are initiated using warm or thermal blankets if the temperature drops below 96.8° F (36.0° C); rewarm the client no faster than 1.8 degrees/hr to prevent shivering, and discontinue rewarming procedures when the temperature approaches 98.6° F (37.0° C).
h. Potassium is administered intravenously as prescribed to maintain the potassium level between 4 and 5 mEq/L (4 to 5 mmol/L) to prevent dysrhythmias.
i. The client is monitored for signs of cardiac tamponade, which will include sudden cessation of previously heavy mediastinal drainage, jugular vein distention with clear lung sounds, equalization of right atrial (RA) pressure and pulmonary artery wedge pressure, and pulsus paradoxus (see Section X, I).
j. Pain is monitored, differentiating sternotomy pain from anginal pain, which would indicate graft failure.

7. Alarm safety and alarm fatigue: Refer to Section IX, I.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

8. Transfer of the client from the cardiac surgical unit
   a. Monitor vital signs, level of consciousness, and peripheral perfusion.
   b. Monitor for dysrhythmias.
   c. Auscultate lungs and assess respiratory status.
   d. Encourage the client to splint the incision, cough, deep-breathe, and use the incentive spirometer to raise secretions and prevent atelectasis.
   e. Monitor temperature and white blood cell count, which can indicate infection if elevated after 3 to 4 days.
   f. Provide adequate fluids and hydration as prescribed to liquefy secretions.
   g. Assess suture line and chest tube insertion sites for redness, purulent discharge, and signs of infection.
   h. Assess sternal suture line for instability, which may indicate infection.
   i. Guide the client to gradually resume activity.
   j. Assess the client for tachycardia, **postural (orthostatic) hypotension**, and fatigue before, during, and after activity.
   k. Discontinue activities if the BP drops more than 10 to 20 mm Hg or if the pulse increases more than 10 beats per minute.
   l. Monitor episodes of pain closely.
   m. See Box 70.19 for home care instructions.

XI. Complex Renal and Urinary Problems

A. Urosepsis
1. Urosepsis is a gram-negative bacteremia originating in the urinary tract.
2. The most common causative organism is *Escherichia coli*.
3. In a client who is immunocompromised, a common cause is infection from an indwelling urinary catheter or an untreated urinary tract infection (UTI).
4. The major problem is the ability of this bacterium to develop resistant strains.
5. Urosepsis can lead to septic shock if not treated aggressively.
6. Assessment: Fever is the most common and earliest manifestation.
7. Interventions
   a. Obtain a urine specimen for urine culture and sensitivity before administering antibiotics.
   b. Administer antibiotics intravenously as prescribed, usually until the client has been afebrile for 3 to 5 days.
   c. Switch to oral antibiotics as prescribed after the 3- to 5-day afebrile period.

B. Continuous renal replacement therapy
1. Continuous renal replacement therapy (CRRT) provides continuous ultrafiltration of extracellular fluid and clearance of urinary toxins over a period of 8 to 24 hours; used primarily for clients in acute kidney injury (AKI) or critically ill clients with chronic kidney disease (CKD) who cannot tolerate hemodialysis.
2. Water, electrolytes, and other solutes are removed as the client's blood passes through a hemofilter.
3. Because rapid shifts in fluids and electrolytes typically do not occur, hemofiltration is usually better tolerated by critically ill clients.
4. There are five variations of CRRT (Box 70.20), some that require a hemodialysis machine and others that rely on the client's BP to power the system.
5. If CRRT does not require a hemodialysis machine, the client's mean arterial BP needs to be maintained above 60 mm Hg, and arterial and venous access sites are necessary.

BOX 70.19 Home Care Instructions for the Client Who Has Had Cardiac Surgery

- Progressive return to activities at home
- Limiting of pushing or pulling activities for 6 weeks following discharge
- Maintenance of incisional care and reporting signs of redness, swelling, or drainage
- Sternotomy incision heals in about 6 to 8 weeks
- Avoidance of crossing legs; wearing elastic hose as prescribed until edema subsides, and elevating the surgical limb (if used to obtain the graft) when sitting in a chair
- Use of prescribed medications
- Dietary measures, including the avoidance of saturated fats and cholesterol and the use of salt
- Resumption of sexual intercourse on the advice of the health care provider after exercise tolerance is assessed (usually, if the client can walk one block or climb two flights of stairs without symptoms, the client can resume sexual activity safely)

XII. Complex Neurological Problems

A. Traumatic head injury
1. Head injury is trauma to the skull, resulting in mild to extensive damage to the brain.

BOX 70.20 Types of Continuous Renal Replacement Therapy

- Continuous venovenous hemofiltration (CVVH)
- Continuous arteriovenous hemofiltration (CAVH)
- Continuous venovenous hemodialysis (CVVHD)
- Continuous arteriovenous hemodialysis (CAVHD)
- Slow continuous ultrafiltration (SCUF)

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.21 Types of Head Injuries

Concussion
- Concussion is a jarring of the brain within the skull; there may or may not be a loss of consciousness.

Contusion
- Contusion is a bruising type of injury to the brain tissue.
- Contusion may occur along with other neurological injuries, such as subdural or extradural collections of blood.

Skull Fractures
- Linear
- Depressed
- Compound
- Comminuted

Epidural Hematoma
- The most serious type of hematoma; epidural hematoma forms rapidly and results from arterial bleeding.
- The hematoma forms between the dura and the skull from a tear in the meningeal artery.
- It is often associated with temporary loss of consciousness, followed by a lucid period that then rapidly progresses to a coma.
- Epidural hematoma is a surgical emergency.

Subdural Hematoma
- Subdural hematoma forms slowly and results from a venous bleed.
- It occurs under the dura as a result of tears in the veins crossing the subdural space.

Intracerebral Hemorrhage
- Intracerebral hemorrhage occurs when a blood vessel within the brain ruptures, allowing blood to leak inside the brain.

Subarachnoid Hemorrhage
- A subarachnoid hemorrhage is bleeding into the subarachnoid space. It may occur as a result of head trauma or spontaneously, such as from a ruptured cerebral aneurysm.

2. Immediate complications include cerebral bleeding, hematomas, cerebral edema, uncontrolled increased ICP, infections, and seizures.
3. Changes in personality or behavior, cranial nerve deficits, and any other residual deficits depend on the area of the brain damage and the extent of the damage.

B. Types of head injuries (Box 70.21)
1. Open
   - **a.** Scalp lacerations
   - **b.** Fractures in the skull
   - **c.** Interruption of the dura mater
2. Closed
   - **a.** Concussions
   - **b.** Contusions
   - **c.** Fractures

C. Hematoma
1. A collection of blood in the tissues that can occur as a result of a subarachnoid hemorrhage or an intracerebral hemorrhage
2. Assessment
   - **a.** Assessment findings depend on the injury.
   - **b.** Clinical manifestations usually result from increased ICP.
   - **c.** Changing neurological signs in the client
   - **d.** Changes in level of consciousness
   - **e.** Airway and breathing pattern changes
   - **f.** Vital signs change, reflecting increased ICP (rise in blood pressure with widening pulse pressure; slowing of pulse).
   - **g.** Headache, nausea, and vomiting
   - **h.** Visual disturbances, pupillary changes, and papilledema
   - **i.** Nuchal rigidity (not tested until spinal cord injury is ruled out)
   - **j.** Cerebrospinal fluid (CSF) drainage from the ears or nose
   - **k.** Weakness and paralysis
   - **l.** Posturing
   - **m.** Decreased sensation or absence of feeling
   - **n.** Reflex activity changes
   - **o.** Seizure activity

CSF can be distinguished from other fluids by the presence of concentric rings (bloody fluid surrounded by yellowish stain; halo sign) when the fluid is placed on a white sterile background, such as a gauze pad. CSF also tests positive for glucose when tested using a strip test.

3. Interventions
   - **a.** Monitor respiratory status and maintain a patent airway, because increased carbon dioxide (CO_2) levels increase cerebral edema.
   - **b.** If Glasgow Coma Scale (GCS) score is less than 8, intubation is considered to protect the airway.
   - **c.** Monitor neurological status and vital signs, including temperature.
   - **d.** Monitor for increased ICP.
   - **e.** Maintain head elevation to reduce venous pressure.
   - **f.** Prevent neck flexion.
   - **g.** Initiate normothermia measures for increased temperature.
   - **h.** Assess cranial nerve function, reflexes, and motor and sensory function.
   - **i.** Initiate seizure precautions.
   - **j.** Monitor for pain and restlessness.
   - **k.** Morphine sulfate or opioid medication may be prescribed to decrease agitation and control restlessness caused by pain for the head-injured client on a ventilator; administer with caution because it is a respiratory depressant and may increase ICP.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

l. Monitor for drainage from the nose or ears, because this fluid may be CSF.
m. Do not attempt to clean the nose or suction if drainage occurs; client needs to avoid blowing the nose.
n. Do not clean the ear if drainage is noted, but apply a loose, dry sterile dressing.
o. Check drainage for the presence of CSF.
p. Notify the PHCP if drainage from the ears or nose is noted and if the drainage tests positive for CSF.
q. Instruct the client to avoid coughing, because this increases ICP.
r. Monitor for signs of infection.
s. Prevent complications of immobility.
t. Inform the client and family about the possible behavioral changes that may occur, including those that are expected and those that need to be reported.

D. Craniotomy
1. Surgical procedure that involves an incision through the cranium to remove accumulated blood or a tumor
2. Complications of the procedure include increased ICP from cerebral edema, hemorrhage, or obstruction of the normal flow of CSF.
3. Additional complications include hematomas, hypovolemic shock, hydrocephalus, respiratory and neurogenic complications, pulmonary edema, and wound infections.
4. Complications related to fluid and electrolyte imbalances include diabetes insipidus and inappropriate secretion of antidiuretic hormone.
5. Stereotactic radiosurgery (SRS) may be an alternative to traditional surgery and is usually used to treat tumors and arteriovenous malformations.
6. Preoperative interventions
a. Explain the procedure to the client and family.
b. Prepare to shave the client's head as prescribed (usually done in the operating room) and cover the head with an appropriate covering.
c. Stabilize the client before surgery.
7. Postoperative interventions (Box 70.22)
8. Postoperative positioning (Box 70.23)

E. Increased ICP
1. Increased ICP may be caused by trauma, hemorrhage, growths or tumors, hydrocephalus, edema, or inflammation.
2. Increased ICP can impede circulation to the brain, impede the absorption of CSF, affect the functioning of nerve cells, and lead to brainstem compression and death.
3. Assessment
a. Altered level of consciousness, which is the most sensitive and earliest indication of increasing ICP
b. Headache
c. Abnormal respirations
d. Rise in blood pressure with widening pulse pressure
e. Slowing of pulse
f. Elevated temperature
g. Vomiting
h. Pupil changes

BOX 70.22 Nursing Care Following Craniotomy

- Monitor vital signs and neurological status every 30 to 60 minutes.
- Monitor for increased intracranial pressure (ICP).
- Monitor for decreased level of consciousness, motor weakness or paralysis, aphasia, visual changes, and personality changes.
- Maintain mechanical ventilation to avoid hypoxia and hypercapnia to minimize secondary injury.
- Assess the PHCP's prescription regarding client positioning.
- Maintain head of bed at 30 degrees to promote cerebral perfusion pressure and reduce cerebral edema unless the surgical approach is in the posterior fossa or a burr hole has been made. In these cases, the client is generally kept flat or at a slight elevation (10 to 15 degrees) during the postoperative phase.
- Avoid extreme hip or neck flexion, and maintain the head in a midline neutral position.
- Provide a quiet environment.
- Monitor the head dressing frequently for signs of drainage.
- Mark any area of drainage at least once each nursing shift for baseline comparison.
- Monitor the drain, which may be in place for 24 hours; maintain suction on the drain as prescribed.
- Measure drainage from the drain every 8 hours, and record the amount and color.
- Notify the PHCP if drainage is more than the normal amount of 30 to 50 mL per shift.
- Notify the PHCP immediately of excessive amounts of drainage or a saturated head dressing.
- Record strict measurement of hourly intake and output.
- Maintain fluid restriction at 1500 mL/day as prescribed.
- Monitor electrolyte levels.
- Monitor for dysrhythmias, which may occur as a result of fluid or electrolyte imbalance.
- Apply ice packs or cool compresses as prescribed; expect periorbital edema and ecchymosis of one or both eyes.
- Provide range-of-motion exercises every 8 hours.
- Place antiembolism stockings on the client as prescribed.
- Administer antiseizure medications, antacids, corticosteroids, and antibiotics as prescribed.
- Administer analgesics such as codeine sulfate or acetaminophen as prescribed for pain.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

BOX 70.23 Client Positioning Following Craniotomy

- Positions prescribed following a craniotomy vary with the type of surgery and the specific postoperative surgeon's prescription.
- Always check the surgeon's prescription regarding client positioning.
- Incorrect positioning may cause serious and possibly fatal complications.

Removal of a Bone Flap for Decompression

- To facilitate brain expansion, the client should be turned from the back to the nonoperative side, but not to the side on which the operation was performed.

Posterior Fossa Surgery

- To protect the operative site from pressure and minimize tension on the suture line, position the client on the side, with a pillow under the head for support, and not on the back.

Infratentorial Surgery

- Infratentorial surgery involves surgery below the tentorium of the brain.
- The surgeon may prescribe a flat position without head elevation or may prescribe that the head of the bed be elevated at 30 to 45 degrees.
- Do not elevate the head of the bed in the acute phase of care following surgery without a surgeon's prescription.

Supratentorial Surgery

- Supratentorial surgery involves surgery above the tentorium of the brain.
- The surgeon may prescribe that the head of the bed be elevated at 30 degrees to promote venous outflow through the jugular veins.
- Do not lower the head of the bed in the acute phase of care following surgery without a surgeon's prescription.

4. Late signs of increased ICP include increased systolic blood pressure, widened pulse pressure, and slowed heart rate.
5. Other late signs include changes in motor function from weakness to hemiplegia, a positive **Babinski reflex**, decorticate or decerebrate posturing, and seizures.
6. Interventions
   a. Monitor respiratory status and prevent hypoxia.
   b. Avoid the administration of morphine sulfate and other opioids that depress respirations to prevent the occurrence of hypoxia.
   c. Maintain mechanical ventilation as prescribed; maintaining the $PaCO_2$ at 30 to 35 mm Hg will result in vasoconstriction of the cerebral blood vessels, decreased blood flow, and therefore decreased ICP.
   d. Maintain body temperature.
   e. Prevent shivering, which can increase ICP.
   f. Decrease environmental stimuli.
   g. Monitor electrolyte levels and acid–base balance.
   h. Monitor intake and output.
   i. Limit fluid intake to 1200 mL/day as prescribed.
   j. Instruct the client to avoid straining activities, such as coughing and sneezing.
   k. Instruct the client to avoid Valsalva's maneuver.

For the client with increased ICP, elevate the head of the bed 30 to 40 degrees, avoid the Trendelenburg's position, and prevent flexion of the neck and hips.

7. Medications (Box 70.24)
8. Surgical intervention: Also see Chapter 39 for additional information on ventriculoperitoneal shunts (Box 70.25).

F. Spinal cord injury
   1. Trauma to the spinal cord causes partial or complete disruption of the nerve tracts and neurons.
   2. The injury can involve contusion, laceration, or compression of the cord.
   3. Spinal cord edema develops; necrosis of the spinal cord can develop as a result of compromised capillary circulation and venous return.
   4. Loss of motor function, sensation, reflex activity, and bowel and bladder control may result.
   5. The most common causes include motor vehicle crashes, falls, sporting and industrial accidents, and gunshot or stab wounds.
   6. Complications related to the injury include respiratory failure, **autonomic dysreflexia**, spinal shock, further cord damage, and death.
   7. Most frequently involved vertebrae
      a. Cervical—C5, C6, and C7
      b. Thoracic—T12
      c. Lumbar—L1

G. Transection of the cord
   1. Complete transection of the cord: The spinal cord is severed completely, with total loss of sensation, movement, and reflex activity below the level of injury.
   2. Partial transection of the cord
      a. The spinal cord is damaged or severed partially.
      b. The symptoms depend on the extent and location of the damage.
      c. If the cord has not suffered irreparable damage, early treatment is needed to prevent partial damage from developing into total and permanent damage.

H. Spinal cord syndromes in partial transection or injury (Fig. 70.27)
   1. Central cord syndrome
      a. Occurs from damage in the central portion of the spinal cord

Telegram & Insta: NCLEX_RN_Edu

BOX 70.24 Medications for Increased Intracranial Pressure

Antiseizure

- Seizures increase metabolic requirements and cerebral blood flow and volume, thus increasing intracranial pressure (ICP).
- Medications may be given prophylactically to prevent seizures.

Antipyretics and Muscle Relaxants

- Temperature reduction decreases metabolism, cerebral blood flow, and thus ICP.
- Antipyretics prevent temperature elevations.
- Muscle relaxants prevent shivering.

Blood Pressure Medication

- Blood pressure medication may be required to maintain cerebral perfusion at a normal level.
- Notify the primary health care provider if the blood pressure range is lower than 100 or higher than 150 mm Hg systolic.

Corticosteroids

- Corticosteroids are not recommended for cerebral edema in traumatic brain injury but are useful for brain tumors and meningitis.
- Corticosteroids stabilize the cell membrane and reduce leakiness of the blood–brain barrier.
- Corticosteroids decrease cerebral edema in vasogenic edema around tumors and abscesses.
- A histamine blocker may be administered to counteract the excess gastric secretion that occurs with the corticosteroid.
- Clients must be withdrawn slowly from corticosteroid therapy to reduce the risk of adrenal crisis.

Intravenous Fluids

- Fluids are administered intravenously; an infusion pump is always used to control the amount administered.
- Infusions are monitored closely because of the risk of promoting additional cerebral edema and fluid overload.

Hyperosmotic Agent

- A hyperosmotic agent increases intravascular pressure by drawing fluid from the interstitial spaces and from the brain cells.
- Monitor renal function.
- Diuresis is expected.

BOX 70.25 Surgical Intervention for Chronic Increased Intracranial Pressure: Ventriculoperitoneal Shunt

Description

- A ventriculoperitoneal shunt diverts cerebrospinal fluid from the ventricles into the peritoneum.

Postprocedure Interventions

- Position the client supine and turn from the back to the nonoperative side.
- Monitor for signs of increasing intracranial pressure resulting from shunt failure.
- Monitor for signs of infection.

b. Loss of motor function is more pronounced in the upper extremities, and varying degrees and patterns of sensation remain intact.

2. Anterior cord syndrome
   a. Caused by damage to the anterior portion of the gray and white matter of the spinal cord
   b. Motor function, pain, and temperature sensation are lost below the level of injury; however, the sensations of position, vibration, and touch remain intact.
3. Posterior cord syndrome
   a. Caused by damage to the posterior portion of the gray and white matter of the spinal cord
   b. Motor function remains intact, but the client experiences a loss of vibratory sense, crude touch, and position sensation.
4. Brown-Séquard syndrome
   a. Results from penetrating injuries that cause hemisection of the spinal cord or injuries that affect half of the cord
   b. Motor function, vibration, proprioception, and deep touch sensations are lost on the same side of the body (ipsilateral) as the lesion or cord damage.
   c. On the opposite side of the body (contralateral) from the lesion or cord damage, the sensations of pain, temperature, and light touch are affected.
5. Conus medullaris syndrome
   a. Follows damage to the lumbar nerve roots and conus medullaris in the spinal cord
   b. The client experiences bowel and bladder areflexia and flaccid lower extremities.
   c. If damage is limited to the upper sacral segments of the spinal cord, bulbospongiosus penile (erection) and micturition reflexes will remain.
6. Cauda equina syndrome
   a. Occurs from injury to the lumbosacral nerve roots below the conus medullaris
   b. The client experiences areflexia of the bowel, bladder, and lower reflexes.

l. Assessment of spinal cord injuries (Box 70.26)
1. Dependent on the level of the cord injury
2. Level of spinal cord injury: Lowest spinal cord segment with intact motor and sensory function
3. Respiratory status changes
4. Motor and sensory changes below the level of injury
5. Total sensory loss and motor paralysis below the level of injury
6. Loss of reflexes below the level of injury

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

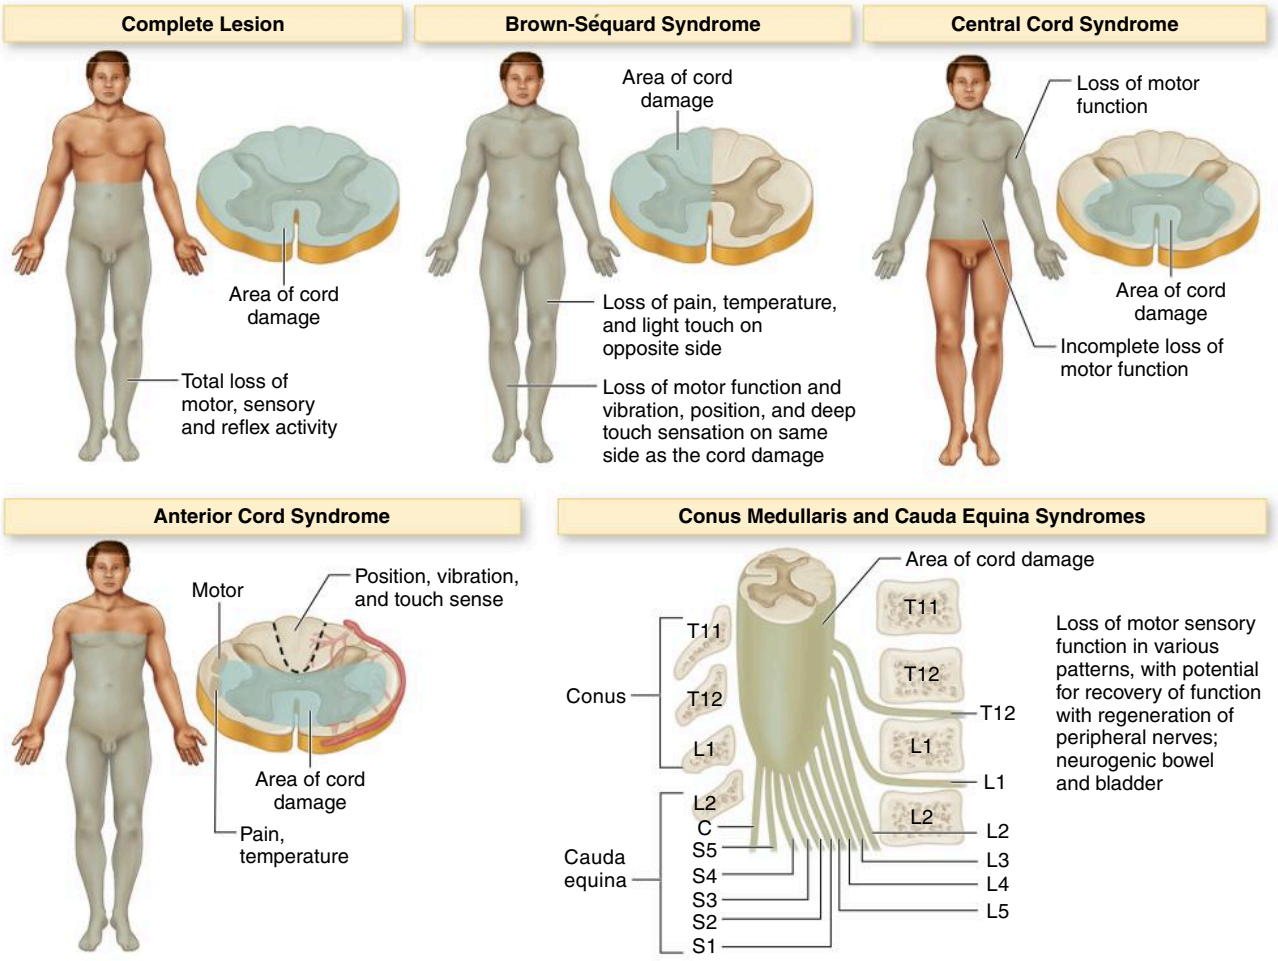

FIG. 70.27 Common spinal cord syndromes.

BOX 70.26 Manifestations: Neurogenic Shock, Spinal Shock, and Autonomic Dysreflexia

Neurogenic Shock

- Hypotension
- Bradycardia

Spinal Shock

- Flaccid paralysis
- Loss of reflex activity below the level of the injury
- Bradycardia
- Hypotension
- Paralytic ileus

Autonomic Dysreflexia

- Sudden onset, severe throbbing headache
- Severe hypertension and bradycardia
- Flushing above the level of the injury
- Pale extremities below the level of the injury
- Nasal stuffiness
- Nausea
- Dilated pupils or blurred vision
- Sweating
- Piloerection (goose bumps)
- Restlessness and a feeling of apprehension

7. Loss of bladder and bowel control
8. Urinary retention and bladder distention
9. Presence of sweat, which does not occur on paralyzed areas

J. Cervical injuries

1. Injury at C2 to C3 is usually fatal.
2. C4 is the major innervation to the diaphragm by the phrenic nerve.
3. Involvement above C4 causes respiratory difficulty and paralysis of all four extremities.
4. The client may have movement in the shoulder if the injury is at C5 through C8 and may also have decreased respiratory reserve.

K. Thoracic level injuries

1. Loss of movement of the chest, trunk, bowel, bladder, and legs may occur, depending on the level of injury.
2. Leg paralysis (paraplegia) may occur.
3. Autonomic dysreflexia with injuries above T6 and in cervical lesions may occur.
4. Visceral distention from noxious stimuli such as a distended bladder or an impacted rectum may cause reactions such as sweating, bradycardia, hypertension, nasal stuffiness, and gooseflesh.

Telegram & Insta: NCLEX_RN_Edu

L. Lumbar and sacral level injuries

1. Loss of movement and sensation of the lower extremities may occur.
2. S2 and S3 center on micturition; therefore, below this level, the bladder will contract but not empty (neurogenic bladder).
3. Injury above S2 allows them to have an erection, but they are unable to ejaculate because of sympathetic nerve damage.
4. Injury between S2 and S4 damages the sympathetic and parasympathetic response, preventing erection or ejaculation.

M. Emergency interventions

Always suspect spinal cord injury when trauma occurs until this injury is ruled out. Immobilize the client on a spinal backboard with the head in a neutral position to prevent an incomplete injury from becoming complete.

1. Emergency management is critical, because improper movement can cause further damage and loss of neurological function.
2. Assess the respiratory pattern, and maintain a patent airway.
3. Prevent head flexion, rotation, or extension.
4. During immobilization, maintain traction and alignment on the head by placing hands on both sides of the head by the ears.
5. Maintain an extended position.
6. Logroll the client.
7. No part of the body should be twisted or turned, and the client is not allowed to assume a sitting position.
8. In the emergency department, a client who has sustained a cervical fracture should be placed immediately in skeletal traction via skull tongs or halo traction to immobilize the cervical spine and reduce the fracture and dislocation.

N. Interventions during hospitalization

1. Respiratory system
   - **a.** Assess respiratory status, because paralysis of the intercostal and abdominal muscles occurs with C4 injuries.
   - **b.** Monitor arterial blood gas levels and maintain mechanical ventilation if prescribed to prevent respiratory arrest, especially with cervical injuries.
   - **c.** Encourage deep breathing and the use of an incentive spirometer.
   - **d.** Monitor for signs of infection, particularly pneumonia.
2. Cardiovascular system
   - **a.** Monitor for cardiac dysrhythmias.
   - **b.** Assess for signs of hemorrhage or bleeding around the fracture site.
   - **c.** Assess for signs of shock, such as hypotension, tachycardia, and a weak and thready pulse.
   - **d.** Assess the lower extremities for deep vein thrombosis.
   - **e.** Measure circumferences of the calf and thigh to identify increases in size.
   - **f.** Apply antiembolism stockings as prescribed; remove daily to assess skin integrity.
   - **g.** Monitor for orthostatic hypotension when repositioning the client.
3. Neuromuscular system
   - **a.** Assess neurological status.
   - **b.** Assess motor and sensory status to determine the level of injury.
   - **c.** Assess motor ability by testing the client's ability to squeeze hands, spread the fingers, move the toes, and turn the feet.
   - **d.** Assess absence of sensation, hyposensation, or hypersensation by pinching the skin or pricking it with a pin, starting at the shoulders and working down the extremities.
   - **e.** Monitor for signs of autonomic dysreflexia and spinal shock.
   - **f.** Immobilize the client to promote healing and prevent further injury.
   - **g.** Assess pain.
   - **h.** Initiate measures to reduce pain.
   - **i.** Administer analgesics as prescribed.
   - **j.** Monitor for complications of immobility.
   - **k.** Prepare the client for decompression laminectomy, spinal fusion, or insertion of instrumentation or rods if prescribed.
   - **l.** Collaborate with the physical therapist and occupational therapist to determine appropriate exercise techniques, assess the need for hand and wrist splints, and develop an appropriate plan to prevent footdrop.
4. Gastrointestinal system
   - **a.** Assess abdomen for distention and hemorrhage.
   - **b.** Monitor bowel sounds and assess for paralytic ileus.
   - **c.** Prevent bowel retention.
   - **d.** Initiate a bowel control program as appropriate.
   - **e.** Maintain adequate nutrition and a high-fiber diet.
5. Renal system
   - **a.** Prevent urinary retention.
   - **b.** Initiate a bladder control program as appropriate.
   - **c.** Maintain fluid and electrolyte balance.
   - **d.** Maintain adequate fluid intake of 2000 mL/day unless contraindicated.
   - **e.** Monitor for urinary tract infection and calculi.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

6. Integumentary system
   a. Assess skin integrity.
   b. Ensure that linens under the client are wrinkle-free.
   c. Turn the client every 2 hours.
7. Psychosocial integrity
   a. Assess psychosocial status.
   b. Encourage the client to express feelings of anger, depression, and loss.
   c. Discuss the sexual concerns of the client.
   d. Promote rehabilitation with self-care measures, setting realistic goals based on the client's potential functional level.
   e. Encourage contact with appropriate community resources.

O. Spinal and neurogenic shock

1. **Spinal shock:** A complete but temporary loss of motor, sensory, reflex, and autonomic function that occurs immediately after injury as the cord's response to the injury. It usually lasts less than 48 hours but can continue for several weeks.
2. **Neurogenic shock:** Occurs most commonly in clients with injuries above T6 and usually is experienced soon after the injury. Massive vasodilation occurs, leading to pooling of the blood in blood vessels, tissue hypoperfusion, and impaired cellular metabolism.
3. Assessment (see Box 70.26)
4. Interventions
   a. Monitor for signs of shock following a spinal cord injury.
   b. Monitor for hypotension and bradycardia.
   c. Monitor for reflex activity.
   d. Assess bowel sounds.
   e. Monitor for bowel and urinary retention.
   f. Provide supportive measures as prescribed, based on the presence of symptoms.
   g. Monitor for the return of reflexes.

P. **Autonomic dysreflexia** (see Clinical Judgment: Analyze Cues box)

1. Also known as autonomic hyperreflexia
2. It generally occurs after the period of spinal shock is resolved and occurs with lesions or injuries above T6 and in cervical lesions or injuries.
3. It is commonly caused by visceral distention from a distended bladder or impacted rectum.
4. It is a neurological emergency and must be treated immediately to prevent a hypertensive stroke.
5. Assessment (see Box 70.26)
6. Interventions
   a. Raise the head of the bed and ask that the PHCP be notified.
   b. Loosen tight clothing on the client.
   c. Check for bladder distention or other noxious stimulus.
   d. Remove the noxious stimulus
   e. Administer an antihypertensive medication.
   f. Document the occurrence, treatment, and response.

CLINICAL JUDGMENT: ANALYZE CUES

A client who sustained a spinal cord injury above the level of T6 suddenly complains of a severe throbbing headache. The nurse notes that the client's blood pressure is 190/120 mm Hg and the heart rate is 54 beats per minute. The client's face is flushed and the client is sweating and has goose bumps. The nurse considers the client's health problem, a *spinal cord injury*, and the complications associated with an injury above the level of T6. The nurse analyzes the client's presentation and connects these cues to the complication, *autonomic dysreflexia*.

Q. Cervical spine traction for cervical injuries

1. Skeletal traction is used to stabilize fractures or dislocations of the cervical or upper thoracic spine.
2. Two types of equipment used for cervical traction are skull (cervical) tongs and halo traction (halo fixation device).
3. Skull tongs
   a. Skull tongs are inserted into the outer aspect of the client's skull, and traction is applied.
   b. Weights are attached to the tongs, and the client is used as countertraction. The nurse should not add or remove weights.
   c. Determine the amount of weight prescribed to be added to the traction.
   d. Ensure that weights hang securely and freely at all times.
   e. Ensure that the ropes for the traction remain within the pulley.
   f. Maintain body alignment and maintain care of the client on a special bed (such as a RotoRest bed or Stryker or Foster frame) as prescribed.
   g. Turn the client every 2 hours.
   h. Assess the insertion site of the tongs for infection.
   i. Provide sterile pin site care as prescribed.
4. Halo traction
   a. Halo traction is a static traction device that consists of a headpiece with four pins, two anterior and two posterior, inserted into the client's skull.
   b. The metal halo ring may be attached to a vest (jacket) or cast when the spine is stable, allowing increased client mobility.

Telegram & Insta: NCLEX_RN_Edu

c. Monitor the client's neurological status for changes in movement or decreased strength.
d. Never move or turn the client by holding or pulling on the halo traction device.
e. Assess for tightness of the jacket by ensuring that one finger can be placed under the jacket.
f. Assess skin integrity to ensure that the jacket or cast is not causing pressure.
g. Provide sterile pin site care as prescribed.

5. Client education for halo traction device (Box 70.27)
   a. Initiate interventions in support of the client's self-image.
   b. Teach the client and family pin care, care of the vest, and signs and symptoms of infection to report to the PHCP.

R. Interventions for thoracic, lumbar, and sacral injuries
1. Bed rest
2. Immobilization with a body cast if prescribed
3. Assess for respiratory impairment and paralytic ileus, possible complications of the body cast.
4. Use of a brace or corset when the client is out of bed

S. Surgical interventions for thoracic, lumbar, and sacral injuries
1. Decompressive laminectomy
   a. Removal of one or more laminae
   b. Allows for cord expansion from edema; performed if conventional methods fail to prevent neurological deterioration
2. Spinal fusion
   a. Spinal fusion is used for thoracic spinal injuries.
   b. Bone is grafted between the vertebrae for support and to strengthen the back.
3. Postoperative interventions
   a. Monitor for respiratory impairment.
   b. Monitor vital signs, motor function, sensation, and circulatory status in the lower extremities.
   c. Encourage breathing exercises.
   d. Assess for signs of fluid and electrolyte imbalances.
   e. Observe for complications of immobility.
   f. Keep the client in a flat position as prescribed.
   g. Provide cast care if the client is in a full body cast.
   h. Turn and reposition frequently by logrolling side to back to side, using turning sheets and pillows between the legs to maintain alignment.
   i. Administer pain medication as prescribed.
   j. Maintain on NPO status until the client is passing flatus.
   k. Monitor bowel sounds.
   l. Provide the use of a fracture bedpan.
   m. Monitor intake and output.
   n. Maintain nutritional status.

T. Medications
1. Dexamethasone: Used for its antiinflammatory and edema-reducing effects; may interfere with healing because it suppresses the immune system
2. Dextran: Plasma expander used to increase capillary blood flow within the spinal cord and to prevent or treat hypotension
3. Baclofen: Used for clients with upper motor neuron injuries to control muscle spasticity

U. Management of sedation, agitation, and delirium
1. The Society of Critical Care Medicine (SCCM) developed guidelines for managing sedation, agitation, and delirium in critically ill clients.
   a. These guidelines recommend using a standardized tool such as the Richmond Agitation-Sedation Scale (RASS) (Box 70.28) to titrate sedation medications, because not all individuals metabolize these medications at the same rate (Box 70.29).
   b. Ruling out pain as a cause of agitation is an important consideration in deciding how to titrate sedation medications.

BOX 70.27 Client Education for a Halo Fixation Device

- Notify the PHCP if the halo vest (jacket) or ring bolts loosen.
- Use fleece or foam inserts to relieve pressure points.
- Keep the vest lining dry.
- Clean the pin site daily.
- Notify the PHCP if redness, swelling, drainage, open areas, pain, tenderness, or a clicking sound occurs from the pin site.
- A sponge bath or tub bath is allowed; showers are not allowed.
- Assess the skin under the vest daily for breakdown, using a flashlight.
- Do not use any products other than shampoo on the hair.
- When shampooing the hair, cover the vest with plastic.
- When getting out of bed, roll onto the side and push on the mattress with the arms.
- Never use the metal frame for turning or lifting.
- Use a rolled towel or pillowcase between the back of the neck and bed or next to the cheek when lying on the side, and raise the head of the bed to increase sleep comfort.
- Adapt clothing to fit over the halo device.
- Eat foods high in protein and calcium to promote bone healing.
- Have the correct-sized wrench available at all times for an emergency (tape the wrench to the vest).
- If cardiopulmonary resuscitation is required, the anterior portion of the vest will be loosened and the posterior portion will remain in place to provide stability.

Telegram & Insta: NCLEX_RN_Edu

BOX 70.28 Richmond Agitation-Sedation Scale (RASS)

−5	Unresponsive	Minimal or no response to stimuli; does not follow commands
−4	Deep sedation	No response to voice; movement or eye opening to physical stimuli
−3	Moderate sedation	Movement or eye opening to voice without eye contact
−2	Light sedation	Briefly awakens to eye contact to voice for less than 10 seconds
−1	Drowsy	Not fully alert, but with sustained awakening with eye opening and contact to voice for more than 10 seconds
0		Alert and calm
+ 1	Restless	Anxious without aggressive movements
+ 2	Agitated	Frequent movements that are nonpurposeful
+ 3	Very agitated	Pulls out or removes tubes, aggressive
+ 4	Combative	Overtly combative and violent, danger to staff

Adapted from Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. p. 73.

BOX 70.29 Levels of Sedation

- Light sedation: Relieving anxiety with pharmacological measures so that the client can still respond to verbal commands
- Moderate sedation: Depression of the client's consciousness with pharmacological measures; known as procedural sedation
- Deep sedation: Depression of the client's consciousness with pharmacological measures to the point that the client cannot maintain a patent airway
- General anesthesia: Depression of the client's consciousness using multiple medications administered by an anesthesiologist or nurse anesthetist

Adapted from Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 73-75.

2. Sedation
   a. Sedation is classified as light, moderate, deep, and general anesthesia (see Box 70.29).
   b. Pharmacological sedation includes the use of benzodiazepines (diazepam, lorazepam, midazolam), sedative-hypnotics (propofol), and centrally acting alpha-adrenergic agonists (dexmedetomidine).
3. Propofol
   a. Propofol is contained in glass and is a white milky substance. It is a lipid emulsion substance with a short half-life that can be easily titrated because it is rapidly eliminated from the body, within 30 minutes.
   b. Opiates should be added for pain control and amnesic effects, because propofol does not produce amnesia.
   c. Propofol-related infusion syndrome causing metabolic acidosis, muscular weakness, rhabdomyolysis, myoglobinuria, acute kidney injury, and cardiac dysrhythmias has been known to occur.
   d. Propofol is conducive to bacterial growth; therefore, infusion sets should be changed every 6 to 12 hours.
4. Dexmedetomidine
   a. Dexmedetomidine is used as a short-term sedative (24 hours or less) in mechanically ventilated clients.
   b. This medication causes sedation and analgesic effects and allows for clients to be minimally interactive while sedated. It can still be used even after extubation to help with anxiety related to weaning.
   c. It is eliminated from the body within 2 hours, or dramatically longer in the case of liver failure.
5. Agitation
   a. A hyperactive state that results in movements ranging from slight restlessness to pulling out lines or tubes or physical aggression
   b. Common causes include pain, anxiety, delirium, hypoxia, ventilator dyssynchrony, neurological injury, uncomfortable position, full bladder, sleep deprivation, alcohol withdrawal, sepsis, medication reaction, and organ failure.
   c. Assessed using RASS, and the goal is to treat the cause rather than overmedicate.
   d. Haloperidol rather than benzodiazepines should be used to manage acute agitation; benzodiazepines can cause delirium.
   e. If the client is at risk for harming themselves or others, a benzodiazepine may be prescribed.
6. Delirium
   a. Global impairment of cognitive processes with a sudden onset, associated with disorientation, impaired short-term memory, hallucinations or other altered sensory patterns, abnormal thought processes, and inappropriate behavior
   b. Common causes include acute brain dysfunction, sepsis, critical illness, or overall dysfunction of vital organs.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

c. Differentiating between agitation and delirium can be difficult but is important in targeting the cause and implementing an appropriate treatment approach.
d. Standardized assessment tools are available that can be used in tandem with RASS; one tool is the Confusion Assessment Method for the Intensive Care Unit (CAM-ICU).
e. Haloperidol or atypical antipsychotics can be used for hyperactive delirium.
f. Preventive measures for delirium include spontaneous awakening for sedated clients, daily delirium monitoring using a standardized tool, mobility, and initiation of sleep protocols in which nursing care is clustered to provide uninterrupted rest periods.

XIII. Complex Immune Problems

A. Anaphylaxis
1. A serious and immediate hypersensitivity reaction that releases histamine from the damaged cells
2. Anaphylaxis can be systemic or cutaneous (localized).
3. Assessment (Fig. 70.28)
4. Interventions (see Clinical Judgment: Take Action box)

CLINICAL JUDGMENT: TAKE ACTION

A client is brought to the emergency department by the spouse, who reports that the two were visiting family when the client began to have difficulty breathing and felt that the throat was closing. The spouse reports that the client is allergic to cats and that the family members they were visiting have three cats. The spouse notes that although the cats were in the cellar during their visit, the cat dander presented a problem. The emergency department nurse takes the following actions in the care of the client:

- Quickly assesses respiratory status and ensures a patent airway
- Administers resuscitation measures as necessary
- Seeks out the emergency department physician and calls the Rapid Response Team
- Administers oxygen
- Initiates an intravenous (IV) line and infuses normal saline
- Prepares to administer diphenhydramine, epinephrine, and possibly corticosteroids
- Documents the event, actions taken, and the client's response

The Modified Early Warning Score (MEWS) is a tool that is based on a point system and is helpful in detecting subtle changes in a client's condition related to a declining status. The MEWS is based on assessment of the temperature, heart rate, respiratory rate, systolic blood pressure, and mental status. Urine output and oxygen saturation assessments may also be included as a component of the scoring system. The higher the score, the higher likelihood of the need for medical attention and intensive care.

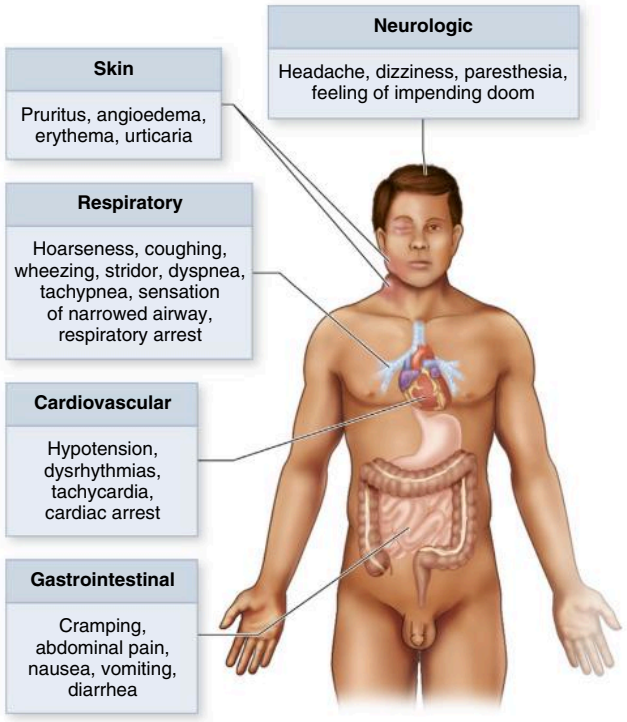

FIG. 70.28 Clinical manifestations of a systemic anaphylactic reaction.

XIV. Shock and Sepsis

A. Shock
1. Four main types of shock: hypovolemic, cardiogenic, vasogenic (distributive), obstructive
a. Hypovolemic shock: The most common type, defined as a shock state caused by internal or external blood or fluid loss
b. Cardiogenic shock: Caused by heart (pump) failure, resulting in diminished cardiac output
c. Vasogenic shock: With this type, the vasculature is dilated, making it difficult for the heart to move blood and fluid to the rest of the body; types include septic shock, anaphylactic shock, and neurogenic shock.
d. Obstructive shock: A type of shock that is caused by a physical obstruction that reduces the filling or outflow of blood from the heart that results in a reduced cardiac output. Conditions that can contribute to this type of shock include cardiac tamponade, tension pneumothorax, superior vena cava syndrome, abdominal compartment syndrome, and pulmonary embolism.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. Causes of vasodilation
   a. Septic shock: Massive infection leads to sepsis as a result of the release of endotoxins from bacteria; this causes vasodilation and pooling of blood.
   b. Anaphylactic shock: An allergic reaction to substances such as drugs, food, or insect bites leads to anaphylactic shock, which results in an acute and life-threatening hypersensitivity reaction. This immediate reaction causes massive vasodilation, release of vasoactive mediators, and an increase in capillary permeability.
   c. Neurogenic shock: A phenomenon that occurs after spinal cord injury. The injury results in massive vasodilation without compensation as a consequence of the loss of spinal nervous system vasoconstrictor tone; this leads to a pooling of blood in the blood vessels.
3. Hemodynamic monitoring is important for assessing a client in any type of shock state and includes:
   a. Cardiac output: Reflects blood flow reaching the tissue. Normal cardiac output is 4 to 6 liters per minute.
   b. Mean arterial pressure: Amount of pressure the blood is placing on the walls of the vessels as the blood leaves the heart. Normal mean arterial pressure is between 70 mm Hg and 105 mm Hg. This measure is an important indicator of adequacy of cardiac output. Mean arterial pressure of greater than 60 mm Hg is needed to maintain perfusion to vital organs.
   c. Central venous pressure: A measure of pressure in terms of right ventricular preload; measures the pressure of the blood returning from the body to the heart. The normal central venous pressure is 3 to 8 mm Hg. An elevated central venous pressure indicates right ventricular failure and volume overload. A low central venous pressure indicates hypovolemia.
   d. Cerebral perfusion pressure: A measure of perfusion to the brain, calculated by subtracting the ICP from the mean arterial pressure. The normal cerebral perfusion pressure is 70 to 100 mm Hg. A central perfusion pressure of less than 50 mm Hg is associated with ischemia and tissue death. A central perfusion pressure of less than 30 mm Hg is incompatible with life.
4. Stages of shock
   a. Stage 1, Initial: Restlessness, increased heart rate, cool and pale skin, agitation
   b. Stage 2, Compensatory: Cardiac output is less than 4 to 6 liters per minute, systolic blood pressure is less than 100 mm Hg, there is decreased urinary output, confusion, and the cerebral perfusion pressure is less than 70 mm Hg.
   c. Stage 3, Progressive: Edema, excessively low blood pressure, dysrhythmias, weak and thready pulses
   d. Stage 4: This stage is unresponsive to vasopressors; there is profound hypotension, the heart rate slows, and multiple organ failure ensues. Most often, the client will not survive.

It is a priority to intervene in the early stages of shock to prevent progression to the later stages.

5. Treatments for shock
   a. Treatment depends on the cause of the shock and the type of shock.
   b. For clients in shock, central venous and pulmonary artery catheters are inserted to monitor hemodynamic status.
   c. Assessment of the central venous pressure, urine output, heart rate, and clinical and mental status is done every 5 to 15 minutes.
   d. Oxygen is administered to assist in tissue perfusion.
   e. Isotonic and electrolyte intravenous solutions such as lactated Ringer's solution and normal saline are frequently used.
   f. Rapid infusion of volume-expanding fluids, including whole blood, plasma, and plasma substitutes such as colloid fluids
   g. Whole blood is effective but is not used often as a treatment measure because of the risk of transfusion reactions.
   h. Administration of medications is withheld until circulating volume has been restored.
   i. The primary goal for medication therapy with shock is to improve tissue perfusion.
   j. Medications used to improve perfusion in shock are administered intravenously via an infusion pump and often via a central line.
   k. It is important to note that if the shock state is cardiogenic in nature, the infusion of volume-expanding fluids may result in pulmonary edema; therefore, restoration of cardiac function is the priority for this type of shock. Cardiotonic medications such as digoxin, dopamine, or norepinephrine may be administered to increase cardiac contractility and induce vasoconstriction.
   l. Once improvement of perfusion is achieved, interventions are then directed toward the underlying cause of the condition.

B. Sepsis
   1. A group of symptoms or syndrome in response to an infection that can include organ dysfunction related to the infection

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

2. The main causative organisms are gram-negative and gram-positive bacteria; however, sepsis can also result from viral, fungal, and parasitic infections.
3. Sepsis diagnostic criteria (Box 70.30)

C. Septic shock
1. Signs and symptoms include persistent hypotension despite adequate fluid resuscitation requiring vasopressors, along with decreased tissue perfusion that progresses to tissue hypoxia.
2. In both sepsis and septic shock, the body's immune response to an invading microorganism is exaggerated, resulting in the activation of proinflammatory and antiinflammatory responses and coagulation abnormalities.
   a. Increased coagulation and decreased fibrinolysis result in platelet and neutrophil aggregation with adherence to endothelium, and endothelial damage related to the formation of microthrombi in the microvasculature.
   b. Endotoxins released from the invading organism's cell wall result in release of the body's cytokines (such as tumor necrosis factor [TNF] and interleukin-1 [IL-1]), which cause vasodilation and increased capillary permeability, which contribute to hypotension.
3. Three major effects septic shock has on the body include vasodilation, maldistribution of blood flow, and myocardial depression.
   a. Vasodilation causes relative hypovolemia and hypotension in euvolemic clients.
   b. Decreased microcirculation causes tissue hypoxia.
   c. Perfusion is further impaired by a decrease in ejection fraction, in which the ventricles dilate to compensate.
   d. Clients who develop septic shock are at risk for the development of respiratory failure and acute respiratory distress syndrome.
4. Interventions
   a. Fluid replacement: 30 to 50 mL/kg fluid resuscitation with isotonic crystalloids; albumin may also be administered as a later intervention.
   b. Vasopressor therapy to increase cardiac output
   c. Intravenous corticosteroids may be administered in clients with inadequate blood pressure readings despite fluid resuscitation and vasopressor therapy.
   d. IV antibiotics should be started within the first hour of sepsis or septic shock; cultures should be obtained before the initiation of antibiotic therapy.
   e. Glucose levels should be maintained below 180 mg/dL (10.02 mmol/L).
   f. Administer stress ulcer prophylaxis if on a mechanical ventilator and venous thromboembolism prophylaxis.
   g. Monitor level of consciousness, cardiovascular status, pulse oximetry, rate and depth of respirations, urine output, bowel sounds, gastric secretions and stools for occult blood, and temperature and skin changes, because the client is at risk for skin breakdown due to decreased tissue perfusion.

D. Systemic inflammatory response syndrome (SIRS)
1. Defined as a systemic inflammatory response that is characterized by generalized inflammation in organs separate from the initial affected area; it is a serious condition and may be caused by a severe bacterial infection (sepsis), trauma, or pancreatitis.
2. SIRS can also be triggered by a variety of different mechanisms: mechanical tissue trauma (burns, crush injuries, surgical procedures); abscess formation; ischemic or necrotic tissue; microbial invasion; endotoxin release from invading microorganisms; global perfusion deficits including postcardiac resuscitation or states of shock; and regional perfusion deficits.

BOX 70.30 Sepsis Diagnostic Criteria

Signs and Symptoms
- Fever (temperature above 100.9° F [38.3° C]) or hypothermia (core temperature below 97° F [36° C])
- Heart rate above 90 beats per minute
- Tachypnea (respiratory rate above 22 breaths per minute)
- Systolic blood pressure (SBP) less than or equal to 100 mm Hg or arterial hypotension (SBP below 90 mm Hg), MAP below 70 mm Hg, or a decrease in SBP of more than 40 mm Hg
- Altered mental status
- Edema or positive fluid balance
- Oliguria
- Ileus (absent bowel sounds)
- Decreased capillary refill or mottling of skin

Laboratory Values
- Hyperglycemia (blood glucose greater than 140 mg/dL (8 mmol/L) in client without diabetes)
- Leukocytosis or leukopenia
- Normal white blood cell count with more than 10% immature bands
- Elevated C-reactive protein
- Elevated procalcitonin
- Serum creatinine increase
- Coagulation abnormalities (INR above 1.5 or PTT above 60 seconds
- Thrombocytopenia (platelets below 100,000/mm^3 [100 × 10^9/L])
- Hyperbilirubinemia (total bilirubin above 4 mg/dL [68 mcmol/L])
- Hyperlactatemia (above 1 mmol/L)

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 1572.

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

E. Multiple organ dysfunction syndrome (MODS)

1. A complication of sepsis; the failure of two or more organ systems as a result of SIRS, in which homeostasis cannot be maintained without intervention
2. Prognosis is poor once three or more organ systems fail.
3. Clinical manifestations and management of SIRS and MODS (Table 70.12)
4. Nursing interventions for SIRS and MODS include early identification of sepsis; prevention and treatment of infections; maintenance of tissue oxygenation; promotion of nutrition to meet metabolic needs; and support of failing organ systems.

TABLE 70.12 Clinical Manifestations and Interventions of SIRS and MODS

Manifestations	Interventions
Respiratory System	
▪ Development of acute respiratory distress syndrome (ARDS)	▪ Maximize oxygen delivery and decrease oxygen consumption ▪ Mechanical ventilation
Cardiovascular System	
▪ Myocardial depression ▪ Systemic vasodilation ▪ Systolic/diastolic dysfunction ▪ Biventricular failure ▪ Decreased systemic vascular resistance, BP, and MAP ▪ Increased cardiac output (CO) related to increased HR and stroke volume (SV)	▪ Central venous or PA catheter or minimally invasive hemodynamic monitoring/arterial pressure monitoring ▪ Volume replacement to increase preload ▪ Maintain MAP >65 mm Hg ▪ Vasopressors ▪ $S_{CV}O_2$ or S_VO_2 monitoring ▪ Balance O_2 supply and demand ▪ ECG monitoring ▪ Circulatory assist devices ▪ Venous thromboembolism prophylaxis
Central Nervous System	
▪ Acute change in mentation ▪ Fever ▪ Hepatic encephalopathy ▪ Seizures ▪ Confusion, delirium, disorientation	▪ Optimize cerebral blood flow and decrease O_2 requirements ▪ Administration of calcium channel blockers to prevent cerebral vasospasm
Endocrine System	
▪ Hyperglycemia and hypoglycemia	▪ Continuous infusion of insulin and glucose to maintain blood glucose levels of 140-180 mg/dL (7.8-10.02 mmol/L)
Renal System	
▪ Prerenal/renal hypoperfusion ▪ Intrarenal: Acute tubular necrosis	▪ Prerenal: Administration of loop diuretics ▪ Intrarenal: Continuous renal replacement therapy
Gastrointestinal System	
▪ Mucosal ischemia, which can cause decreased pH, translocation of gut bacteria, and abdominal compartment syndrome ▪ Hypoperfusion, which can cause decreased peristalsis, paralytic ileus ▪ Mucosal ulceration ▪ GI bleeding	▪ Stress ulcer prophylaxis (antacids, proton pump inhibitors) ▪ Assess for abdominal distention ▪ Dietary consultation ▪ Enteral feedings ▪ Stimulate mucosal activity ▪ Provide essential nutrients and calories
Hepatic System	
▪ Bilirubin >2 mg/dL (34 mcmol/L) ▪ Elevated AST, ALT, gamma-glutamyl transferase (GGT) ▪ Elevated serum ammonia ▪ Decreased serum albumin, prealbumin, and transferrin ▪ Jaundice ▪ Hepatic encephalopathy	▪ Maintain adequate tissue perfusion ▪ Provide nutritional support ▪ Avoid hepatotoxic drugs
Hematological System	
▪ Increased coagulation studies, including increased PTT and increased PT ▪ Thrombocytopenia ▪ Increased D-dimer ▪ Increased fibrin split products	▪ Observe for obvious and occult bleeding ▪ Replace factors being lost via prescribed blood products ▪ Minimize traumatic interventions such as venipunctures and intramuscular injections

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 1585.

PRACTICE QUESTIONS

1. A client receiving routine preoperative fluids had a 1000-mL bag of 5% dextrose in 0.9% sodium chloride hung at 1500. The nurse making rounds at 1545 finds that the client is complaining of a pounding headache and is dyspneic, experiencing chills, and apprehensive, with an increased pulse rate. The intravenous (IV) bag has 400 mL remaining. The nurse would take which action **first?**
   1. Slow the IV infusion.
   2. Sit the client up in bed.
   3. Remove the IV catheter.
   4. Call the primary health care provider (PHCP).

2. Packed red blood cells have been prescribed for a client with anemia who has a hemoglobin level of 6.8 g/dL (68 g/L) and a hematocrit level of 28% (0.28). The nurse takes the client's temperature before hanging the blood transfusion and records 100.6° F (38.1° C) orally. Which action would the nurse take?
   1. Begin the transfusion as prescribed.
   2. Administer an antihistamine and begin the transfusion.
   3. Administer 2 tablets of acetaminophen and begin the transfusion.
   4. Delay hanging the blood and notify the primary health care provider (PHCP).

3. The nurse is caring for a client experiencing acute lower gastrointestinal bleeding. In developing the plan of care, which **priority** problem would the nurse assign to this client?
   1. Low fluid volume because of acute blood loss
   2. Risk for aspiration because of acute bleeding in the GI tract
   3. Risk for infection because of the acute disease process and medications
   4. Weight loss because of a lack of nutrients and increased metabolism

4. The nurse is assessing the functioning of a chest tube drainage system in a client with a chest injury who has just returned from the recovery room following a thoracotomy with wedge resection. Which are the expected assessment findings? **Select all that apply.**
   - ❑ 1. Excessive bubbling in the water seal chamber
   - ❑ 2. Vigorous bubbling in the suction control chamber
   - ❑ 3. Drainage system maintained below the client's chest
   - ❑ 4. 50 mL of drainage in the drainage collection chamber
   - ❑ 5. Occlusive dressing in place over the chest tube insertion site
   - ❑ 6. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation

5. A client is brought to the emergency department with partial-thickness burns to the face, neck, arms, and chest after trying to put out a car fire. The nurse needs to implement which nursing actions for this client? **Select all that apply.**
   - ❑ 1. Restrict fluids.
   - ❑ 2. Assess for airway patency.
   - ❑ 3. Administer oxygen as prescribed.
   - ❑ 4. Place a cooling blanket on the client.
   - ❑ 5. Elevate extremities if no fractures are present.
   - ❑ 6. Prepare to give oral pain medication as prescribed.

6. A client is admitted to a hospital with a diagnosis of diabetic ketoacidosis (DKA). The initial blood glucose level is 950 mg/dL (52.9 mmol/L). A continuous intravenous (IV) infusion of short-acting insulin is initiated, along with IV rehydration with normal saline. The serum glucose level is now decreased to 240 mg/dL (13.37 mmol/L). The nurse would prepare to administer which medication **next**?
   1. An ampule of 50% dextrose
   2. NPH insulin subcutaneously
   3. IV fluids containing dextrose
   4. Phenytoin for the prevention of seizures

7. The nurse is assessing a client with multiple trauma who is at risk for developing acute respiratory distress syndrome. The nurse would assess for which **earliest** sign of acute respiratory distress syndrome?
   1. Bilateral wheezing
   2. Inspiratory crackles
   3. Intercostal retractions
   4. Increased respiratory rate

8. The nurse is caring for a client with chronic kidney disease on continuous renal replacement therapy (CRRT) without the use of a hemodialysis machine. The nurse determines that which parameter is **most important** in ensuring success of this treatment?
   1. Mean arterial pressure (MAP)
   2. Systolic blood pressure (SBP)
   3. Diastolic blood pressure (DBP)
   4. Central venous pressure (CVP)

9. The nurse is monitoring a client with a head injury for signs of increased intracranial pressure. The nurse would note which trend in vital signs if the intracranial pressure is rising?
   1. Increasing temperature, increasing pulse, increasing respirations, decreasing blood pressure
   2. Increasing temperature, decreasing pulse, decreasing respirations, increasing blood pressure
   3. Decreasing temperature, decreasing pulse, increasing respirations, decreasing blood pressure
   4. Decreasing temperature, increasing pulse, decreasing respirations, increasing blood pressure

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

10. A client develops an anaphylactic reaction after receiving morphine. The nurse would plan to institute which actions? **Select all that apply.**
- ❑ 1. Administer oxygen.
- ❑ 2. Quickly assess the client's respiratory status.
- ❑ 3. Document the event, interventions, and client's response.
- ❑ 4. Keep the client supine regardless of the blood pressure readings.
- ❑ 5. Leave the client briefly to contact a primary health care provider (PHCP).
- ❑ 6. Start an intravenous (IV) infusion of D_5W and administer a 500-mL bolus.

11. A client in shock develops a central venous pressure (CVP) of 2 mm Hg and mean arterial pressure (MAP) of 60 mm Hg. Which prescribed intervention would the nurse implement **first**?
1. Increase the rate of O_2 flow.
2. Obtain arterial blood gas results.
3. Insert an indwelling urinary catheter.
4. Increase the rate of intravenous (IV) fluids.

12. A client at risk for shock secondary to pneumonia develops restlessness and is agitated and confused. Urinary output has decreased, and the blood pressure is 92/68 mm Hg. The nurse suspects which stage of shock based on this data?
1. Stage 1
2. Stage 2
3. Stage 3
4. Stage 4

13. The nurse is caring for a client hospitalized for heart failure exacerbation and suspects the client may be entering a state of shock. The nurse plans for which intervention as the **priority** for this client?
1. Administration of dopamine
2. Administration of whole blood
3. Administration of intravenous fluids
4. Administration of packed red blood cells

14. Which clinical findings are consistent with sepsis diagnostic criteria? **Select all that apply.**
- ❑ 1. Urine output 50 mL/hr
- ❑ 2. Hypoactive bowel sounds
- ❑ 3. Temperature of 102° F (38.9° C)
- ❑ 4. Heart rate of 96 beats per minute
- ❑ 5. Mean arterial pressure 65 mm Hg
- ❑ 6. Systolic blood pressure 110 mm Hg

ANSWERS

1. *Answer:* 1
Rationale: The client's symptoms are compatible with circulatory overload. This may be verified by noting that 600 mL has infused in the course of 45 minutes. As there are no data in the question to indicate that the client is in shock, the first action of the nurse is to slow the infusion. Other actions may follow in rapid sequence. The nurse may elevate the head of the bed to aid the client's breathing, if necessary. The nurse also notifies the PHCP. The IV catheter is not removed; it may be needed for the administration of medications to resolve the complication.
Test-Taking Strategy: Note the strategic word, *first*. This tells you that more than one or all of the options are likely to be correct actions and that the nurse needs to prioritize them according to a time sequence. You must be able to recognize the signs of circulatory overload. From this point, select the option that provides the intervention specific to circulatory overload.
Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 296.

2. *Answer:* 4
Rationale: If the client has a temperature higher than 100° F (37.8° C), the unit of blood would not be hung until the primary PHCP is notified and has the opportunity to give further prescriptions. The PHCP likely will prescribe that the blood be administered regardless of the temperature, or may instruct the nurse to administer prescribed acetaminophen and wait until the temperature has decreased before administration, but the decision is not within the nurse's scope of practice to make. The nurse needs a PHCP's prescription to administer medications to the client.
Test-Taking Strategy: Eliminate all options that indicate to begin the transfusion, noting that they are comparable or alike. In addition, the options including antihistamine and acetaminophen indicate administering medication to the client, which is not done without a PHCP's prescription.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 649.

3. *Answer:* 1
Rationale: The priority problem for the client with acute gastrointestinal bleeding among these options is low fluid volume

Telegram & Insta: NCLEX_RN_Edu

Telegram & Insta: NCLEX_RN_Edu

because of acute blood less. This state can result in decreased cardiac output and hypovolemic shock. Although nutrition is a problem and weight loss can result, low fluid volume is more of a priority. The client is at risk for aspiration and infection, but these are not actual problems at this point in time.
Test-Taking Strategy: Note the **strategic word,** *priority.* Recalling that maintaining fluid balance is important for vital bodily functions will assist in directing you to this option. Additionally, note the words, *risk for* in options 2 and 3.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 376-377.

4. *Answer:* 3, 4, 5, 6
Rationale: The bubbling of water in the water seal chamber indicates air drainage from the client and usually is seen when intrathoracic pressure is higher than atmospheric pressure; it may occur during exhalation, coughing, or sneezing. Excessive bubbling in the water seal chamber may indicate an air leak, an unexpected finding. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation is expected. An absence of fluctuation may indicate that the chest tube is obstructed or that the lung has reexpanded and that no more air is leaking into the pleural space. Gentle (not vigorous) bubbling should be noted in the suction control chamber. A total of 50 mL of drainage is not excessive in a client returning to the nursing unit from the recovery room. Drainage that is more than 70 to 100 mL/hr is considered excessive and requires notification of the surgeon. The chest tube insertion site is covered with an occlusive (airtight) dressing to prevent air from entering the pleural space. Positioning the drainage system below the client's chest allows gravity to drain the pleural space.
Test-Taking Strategy: Focus on the **subject,** expected findings associated with chest tube drainage systems. Thinking about the physiology associated with the functioning of a chest tube drainage system will assist in answering this question. The words *excessive bubbling* and *vigorous bubbling* will assist in eliminating these options.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. p. 283.

5. *Answer:* 2, 3, 5
Rationale: The primary goal for a burn injury is to maintain a patent airway, administer intravenous (IV) fluids to prevent hypovolemic shock, and preserve vital organ functioning. Therefore, the priority actions are to assess for airway patency and maintain a patent airway. The nurse then prepares to administer oxygen. Oxygen is necessary to perfuse vital tissues and organs. An IV line should be obtained and fluid resuscitation started. The extremities are elevated to assist in preventing shock and decrease fluid moving to the extremities, especially in the burn-injured upper extremities. The client is kept warm, because the loss of skin integrity causes heat loss. The client is placed on NPO (nothing by mouth) status because of the altered gastrointestinal function that occurs as a result of a burn injury.
Test-Taking Strategy: Focus on the **subject,** actions in a burn injury. Think about the pathophysiology that occurs and how the body reacts to a major burn injury. This assists in eliminating options 1, 4, and 6.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 461-462.

6. *Answer:* 3
Rationale: Emergency management of DKA focuses on correcting fluid and electrolyte imbalances and normalizing the serum glucose level. If the corrections occur too quickly, serious consequences, including hypoglycemia and cerebral edema, can occur. During management of DKA, when the blood glucose level falls to 250 to 300 mg/dL (13.9 to 16.7 mmol/L), the IV infusion rate is reduced and a dextrose solution is added to maintain a blood glucose level of about 250 mg/dL (13.9 mmol/L), or until the client recovers from ketosis. Fifty percent dextrose is used to treat hypoglycemia. NPH insulin is not used to treat DKA. Phenytoin is not a usual treatment measure for DKA.
Test-Taking Strategy: Note the **strategic word,** *next.* Focus on the **subject,** management of DKA. Eliminate option 2 first, knowing that short-duration (rapid-acting) insulin is used in the management of DKA. Eliminate option 1 next, knowing that this is the treatment for hypoglycemia. Note the words *the serum glucose level is now decreased to 240 mg/dL (13.7 mmol/L).* This should indicate that the IV solution containing dextrose is the next step in the management of care.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. p. 408.

7. *Answer:* 4
Rationale: The earliest detectable sign of acute respiratory distress syndrome is an increased respiratory rate, which can begin from 1 to 96 hours after the initial insult to the body. This is followed by increasing dyspnea, air hunger, retraction of accessory muscles, and cyanosis. Breath sounds may be clear or consist of fine inspiratory crackles or diffuse coarse crackles.
Test-Taking Strategy: Note the **strategic word,** *earliest.* Eliminate option 3 first because intercostal retraction is a later sign of respiratory distress. Of the remaining options, recall that adventitious breath sounds (options 1 and 2) would occur later than an increased respiratory rate.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1593-1594.

8. *Answer:* 1
Rationale: Continuous renal replacement therapy (CRRT) provides continuous ultrafiltration of extracellular fluid and clearance of urinary toxins over a period of 8 to 24 hours; it is used primarily for clients with acute kidney injury (AKI) or critically ill clients with chronic kidney disease (CKD) who cannot tolerate hemodialysis. Water, electrolytes, and other solutes are removed as the client's blood passes through a hemofilter. If CRRT does not require a hemodialysis machine, the client's MAP needs to be maintained above 60 mm Hg, and arterial and venous access sites are necessary. The SBP,

Telegram & Insta: NCLEX_RN_Edu

DBP, and CVP may be monitored but each of these measures a component of the cardiovascular status rather than the complete cardiac cycle.
Test-Taking Strategy: Note the **strategic words,** *most important.* Recall that the mean arterial pressure is a measure that takes into account the complete cardiac cycle and is therefore the **umbrella option** that encompasses all other options.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 695, 1080.

9. *Answer:* 2
Rationale: A change in vital signs may be a late sign of increased intracranial pressure. Trends include increasing temperature and blood pressure and decreasing pulse and respirations. Respiratory irregularities also may occur.
Test-Taking Strategy: Focus on the **subject,** signs of increased intracranial pressure. If you remember that the temperature rises, you are able to eliminate options 3 and 4. If you know that the client becomes bradycardic, or know that the blood pressure rises, you are able to select the correct option.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1303-1304.

10. *Answer:* 1, 2, 3
Rationale: An anaphylactic reaction requires immediate action, starting with quickly assessing the client's respiratory status. Although the PHCP and the Rapid Response Team must be notified immediately, the nurse must stay with the client. Oxygen is administered and an IV of normal saline is started and infused per PHCP prescription. Documentation of the event, actions taken, and client outcomes needs to be done. The head of the bed should be elevated if the client's blood pressure is normal.
Test-Taking Strategy: Focus on the **subject,** interventions the nurse takes for an anaphylactic reaction. Read each option carefully, and remember that this is an emergency. Think about the pathophysiology that occurs in this reaction to answer correctly.
Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. p. 351.

11. *Answer:* 4
Rationale: The MAP and CVP are both low for this client, indicating a shock state. Shock is the result of inadequate tissue perfusion. Fluid volume should be immediately restored first to provide adequate perfusion for the client in a shock state. Although increasing the rate of O_2 flow may be a necessary intervention, perfusion is the first priority. Obtaining arterial blood gas results and inserting an indwelling urinary catheter may be necessary interventions to monitor the client's response to prescribed therapy, but these are not the priority.
Test-Taking Strategy: Note the **strategic word,** *first.* Although all interventions are appropriate for the client in a shock state, focus on the client's diagnosis and think about the pathophysiology that occurs in shock; recall that adequate perfusion is the priority.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 100-101.

12. *Answer:* 2
Rationale: Shock is categorized by four stages. Stage 1 is characterized by restlessness, increased heart rate, cool and pale skin, and agitation. Stage 2 is characterized by a cardiac output that is less than 4 to 6 liters per minute, systolic blood pressure of less than 100 mm Hg, decreased urinary output, confusion, and cerebral perfusion pressure that is less than 70 mm Hg. Stage 3 is characterized by edema, excessively low blood pressure, dysrhythmias, and weak and thready pulses. Stage 4 is characterized as unresponsiveness to vasopressors, profound hypotension, slowed heart rate, and multiple organ failure. Most often, the client will not survive.
Test-Taking Strategy: Note the **data in the question**. Think about the stages of shock. Noting the signs of restlessness, agitation, and confusion, as well as the low blood pressure and decreased urinary output, will direct you to Stage 2 as the correct answer.
Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. pp. 1517, 1573-1574.

13. *Answer:* 1
Rationale: The client in this question is likely experiencing cardiogenic shock secondary to heart failure exacerbation. It is important to note that if the shock state is cardiogenic in nature, the infusion of volume-expanding fluids may result in pulmonary edema; therefore, restoration of cardiac function is the priority for this type of shock. Cardiotonic medications such as digoxin, dopamine, or norepinephrine may be administered to increase cardiac contractility and induce vasoconstriction. Whole blood, intravenous fluids, and packed red blood cells are volume-expanding fluids and may further complicate the client's clinical status; therefore, they should be avoided.
Test-Taking Strategy: Note the **strategic word,** *priority,* and focus on the **subject,** suspected shock in a client hospitalized for heart failure exacerbation. Recalling that this client is at risk for fluid volume overload will direct you to the correct option. Also, note that options 2, 3, and 4 are **comparable or alike** and involve the administration of intravenous solutions.
Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. p. 176.

14. *Answer:* 3, 4, 5
Rationale: Sepsis diagnostic criteria with regard to signs and symptoms include the following: Fever (temperature higher than 100.9° F [38.3° C]) or hypothermia (core temperature lower than 97° F [36° C]), heart rate above 90 beats per minute, tachypnea (respiratory rate above 22 breaths per minute), systolic blood pressure (SBP) less than or equal to 100 mm Hg or arterial hypotension (SBP below

Telegram & Insta: NCLEX_RN_Edu

90 mm Hg), MAP of less than 70 mm Hg, or a decrease in SBP of more than 40 mm Hg, altered mental status, edema or positive fluid balance, oliguria, ileus (absent bowel sounds), and decreased capillary refill or mottling of skin.

Test-Taking Strategy: Note the **subject,** clinical findings consistent with sepsis diagnostic criteria. Recalling that a minimum of 30 mL/hr of urine is adequate will assist in eliminating this option. Noting that hypoactive bowel sounds are not suggestive of an ileus eliminates this option. Lastly, recalling that an SBP of 110 mm Hg does not fit the criteria will assist in eliminating this option.

Reference: Urden, L., Stacy, K., & Lough, M. (2022). *Critical care nursing: Diagnosis and management.* (9th ed.). St. Louis: Elsevier. pp. 487-489.

Tuning fork tests, for hearing assessment, 150
Tunneled central venous catheters, 1025
Turner's sign, 660
TURP. *See* Transurethral resection of the prostate (TURP)
Tympanic cavity, 830
Tympanic measurement, of temperature, 117
Tympanic membrane, 836
  assessment of, 150–151
Type 1 diabetes mellitus, 611
Type 2 diabetes mellitus, 611
  medications for, 631–632, 632t
Tyramine, 1004b, 1004f

U
Ulcerative colitis, 661–662
Ulcers
  duodenal, 651
  gastric, 650
  peptic, 649–650
Ultrafiltration, 790
Ultrasound
  eye, 824
  in pregnancy, 293
  quantitative, for bone mineral density measurement, 891
Umbilical clamp, 363
Umbilical cord
  assessment of, in newborn, 361–362
  in fetal circulation, 279
  prolapsed, in labor and birth, 336–337, 337f
Umbilical hernia, 434–435
Umbrella option, 35, 36b
Uncircumcised, of newborn, 367
Unconscious client, care of, 859b
Undoing defense mechanisms, 945t
Unfreezing, in change process, 73
Uniform Anatomical Gift Act, 57
Unilateral neglect, 865b, 866
Unilateral orchiectomy, testicular cancer, 558
Uninsured and underinsured individuals, care for, 46
Unsealed radiation source, 553
Unstable angina, 737
Unstable client with VT, 731–732
Upper gastrointestinal endoscopy, 645
Upper gastrointestinal tract study, 644–646
Upper respiratory airway, 680
Urea breath test, 648
Uremic syndrome, 789–790
Ureteritis, 799
Ureterolithotomy, 803
Ureterostomy, 574
Urethral orifice, epispadias and hypospadias, 483
Urethritis, 798–799
Uric acid in preeclampsia, 307t
Urinalysis, 781
  multiple myeloma, 557
  in pregnancy, 293
Urinary alterations, 218–219
Urinary assessment, 218
Urinary catheters, 220–221, 221b
Urinary diversion, 222–224, 572, 573f
Urinary incontinence, 219–220
Urinary problems, 1069
Urinary retention, 197
Urinary system, 267
Urinary tract
  bladder, as radiation therapy side effect, 410t
  physiological maternal changes of, in postpartum period, 344
Urinary tract analgesics, 813, 813b
Urinary tract antiseptics, 811, 812b
Urinary tract infection, 798, 798b
  in pregnancy, 315
Urinary tube, 1039
Urinary urgency and frequency, 289
Urine
  culture and sensitivity testing, 782
  24-hour collection of, 781–782
Urine culture, in pregnancy, 293
Urine output in preeclampsia, 307t
Urine production, 780
Urine specific gravity, in dehydration, pediatric, 417t
Urine testing, in diabetes mellitus, 613
  pediatric, 420
Urolithiasis, 801
Urosepsis, 1069
Uterine activity, suppressing, tocolytics in, 380, 381t
Uterine atony, postpartum, 350
Uterine enlargement, 285
Uterine inversion, in labor and birth, 339–340
Uterine phases, 277, 278b
Uterine stimulants, oxytocin, 383–384, 384b
Uterus, 383
  inversion of, in labor and birth, 339–340
  involution of, in postpartum period, 343, 344f
  rupture of, in labor and birth, 339
  size of, 287
  structures and functions, 277
  subinvolution of, in postpartum period, 353
Uveal tract, 822
Uvula, 152

V
Vaccine
  COVID-19 (coronavirus), 714
  for influenza, 712–713
  pneumococcal conjugate, 690, 714
  pneumococcal polysaccharide, 714
  reactions, 251
  rubella, for maternity and newborn medications, 385
Vacuum extraction, 332
Vagina
  mucous membranes of, 285
  physiological maternal changes of, in postpartum period, 343–344
  secretions of, 288
  structures and functions, 277
Vaginal candidiasis, in pregnancy, 314
Vaginal discharge, during pregnancy, 289–290
Vaginal ring, 387
Vaginal secretions, 295
Vagotomy, 650
Vagus nerve, 159t–160t
Valproates, 881
Valproic acid, 881
Valsalva maneuver, 733
Valuables, safeguarding of client's, 61
Valve replacement, client instructions following, 745b
Valvotomy, 744
Valvular heart disease, 743–744
Vanillylmandelic acid (VMA), 24-hour urine collection for, 601–602
Variant angina, 737
Varicella (chickenpox), 511, 511f
Varicella vaccine, 250
Varicose veins, 747
  during pregnancy, 290
Vascular access port, for intravenous therapy, 1025
Vascular disorders, 744–745
Vascular spider nevi, 288
Vascular system, 722
  peripheral, assessment of, 155, 156b
Vasodilation, causes of, 1080
Vasogenic shock, 1079
Vaso-occlusive crisis, in sickle cell anemia, 400b
Vasopressin, 626
Vastus lateralis muscle, pediatric injection in, 521f, 521t
Vegan and vegetarian diets, 139–140, 296
Vein stripping, 747
Veins, 722, 1020
Vena cava and descending aorta compression, 334
Vena cava filter, 752, 752f
Vena cava syndrome, in labor and birth, 337
Venipuncture, 1020
Venous insufficiency, 746–747
Venous thrombosis, 744–745
Vented tubing, 1018–1019
Ventilation-perfusion (V/Q) lung scan, 683
Ventilator alarms, causes of, 1062b
Ventilators, mechanical, respiratory alkalosis due to overventilation by, 109b
Ventricles, 854
Ventricular dysrhythmias, 731f
Ventricular fibrillation (VF), 732
Ventricular septal defect (VSD), 470
Ventricular tachycardia (VT), 731–732
Ventriculoatrial shunt, for hydrocephalus, 490
Ventriculoperitoneal shunt, for hydrocephalus, 489, 490f
Ventrogluteal muscle, pediatric injection in, 521t
Venturi mask, 1058, 1060f
Venules, 722
Veracity, 53b
Vernix caseosa, in newborn, 361
Vertigo, 835
Vesicostomy, 575
Vesicoureteral reflux (VUR), 481–482
Vestibular assessment, 151b
Vestibulocochlear nerve, 159t–160t
Vinca alkaloids, 591, 592b
Violations, invasion of, 60b

United States (U.S.) Top 100 Prescription Medications (by Generic Name)

Acetaminophen; Hydrocodone
Acetaminophen; Oxycodone
Albuterol
Alendronate
Allopurinol
Alprazolam
Amitriptyline
Amlodipine
Amoxicillin
Amoxicillin; Clavulanate
Apixaban
Aripiprazole
Aspirin
Atenolol
Atorvastatin
Azithromycin
Budesonide; Formoterol
Bupropion
Buspirone
Carvedilol
Cephalexin
Cetirizine
Cholecalciferol
Citalopram
Clonazepam
Clonidine
Clopidogrel
Cyclobenzaprine
Dextroamphetamine; Dextroamphetamine Saccharate; Amphetamine; Amphetamine Aspartate
Diclofenac
Diltiazem
Doxycycline
Duloxetine
Ergocalciferol
Escitalopram
Estradiol
Ethinyl Estradiol; Norethindrone
Ethinyl Estradiol; Norgestimate
Fenofibrate
Finasteride
Fluoxetine
Fluticasone
Fluticasone; Salmeterol
Folic Acid
Furosemide
Gabapentin
Glimepiride
Glipizide
Hydrochlorothiazide
Hydrochlorothiazide; Lisinopril
Hydrochlorothiazide; Losartan
Hydroxyzine
Ibuprofen
Insulin Aspart
Insulin Glargine
Insulin Lispro
Lamotrigine
Latanoprost
Levetiracetam
Levothyroxine
Lisdexamfetamine
Lisinopril
Loratadine
Lorazepam
Losartan
Lovastatin
Meloxicam
Metformin
Methylphenidate
Metoprolol
Montelukast
Naproxen
Omeprazole
Ondansetron
Oxycodone
Pantoprazole
Paroxetine
Potassium
Pravastatin
Prednisone
Pregabalin
Propranolol
Quetiapine
Rivaroxaban
Rosuvastatin
Sertraline
Simvastatin
Sitagliptin
Spironolactone
Sumatriptan
Sulfamethoxazole; Trimethoprim
Tamsulosin
Tizanidine
Topiramate
Tramadol
Trazodone
Venlafaxine
Warfarin
Zolpidem

Information Sources:

Note: The data source (MEPS prescribed medicines file) is released annually by the U.S. Government. This data release represents survey data from two years prior. The ClinCalc DrugStats Database sanitizes and standardizes this data, and is typically released within a few months of the MEPS release. There is an inherent delay in collecting the survey data (eg, in the 2020 calendar year), MEPS releasing the data from patients (August 2022), and the ClinCalc DrugStats release (a few months later, classified as the 2020 drug list). https://clincalc.com/DrugStats/Top200Drugs.aspx

Prescription data source: Medical Expenditure Panel Survey (MEPS) 2013-2019. Agency for Healthcare Research and Quality (AHRQ), Rockville, MD. ClinCalc DrugStats Database version 2021.10.

Test-Taking Strategy Guide

The Subject of the Question

Communication	Are there any cultural/spiritual considerations? Focus on the client of the question and the feelings, concerns, anxieties, and fears of the client. Use therapeutic communication techniques to identify the correct option.
Pharmacology	Is the question asking about an intended effect, side effect, adverse effect, or toxic effect? Focus on the diagnosis, if one is noted. Use general guidelines and assessment/data collection guidelines. Use medical terminology to determine the medication classification.
Lab Values	Are the lab values normal or abnormal? What is the diagnosis? What organ system is affected? Relate the client's disorder to the lab test that monitors the affected organ.
Positioning	Review the primary health care provider's prescription. What is the diagnosis? What organ system is affected? What complications do you want to prevent?
Medication and IV Calculations	Follow the formula. Is it necessary to convert a unit of measure? Use a calculator. Place decimals in correct places. Round answer if asked to do so. Recheck for accuracy.
Diets	Is the question asking about a specific diet or food item? What is the diagnosis? What organ system is affected? Relate the client's disorder to the correct diet.
Disasters	What type of disaster or mass casualty event occurred? Is the disaster external or internal to the health care agency? What resources are available? Which victim sustained a life-threatening injury? Survivability—who can you save?
Delegating/ Assignment-Making	Think about the client's needs—safety is a priority. To whom is the task being assigned? Noninvasive and basic care activities can be assigned to Assistive Personnel.

Test-Taking Strategy Guide

Questions That Require Prioritization

QUESTION

- Read every word.
- Identify the case event.
- Identify the question query.
- What is the subject of the question?
- Does the question contain a positive or a negative event query?
- What are the strategic words or phrases?
- Do the ABCs apply?
  1. Airway
  2. Breathing
  3. Circulation
- Does Maslow's Hierarchy of Needs apply?
  1. Physiological needs
  2. Safety needs
  3. Psychosocial needs
- Do the steps of the nursing process apply? Assessment/data collection is the first action.
- Does the question present an emergency situation? If it does, then an action may be the priority.

OPTIONS

- Read every word.
- Focus on the subject and data in the question; is there abnormal data?
- Consider available resources.
- Use the process of elimination.

The Question and the Options

QUESTION

- Read every word.
- Identify the case event.
- Identify the question query.
- Visualize the situation.
- Does the question contain a positive or a negative event query?
- Avoid the "What if?" syndrome or reading into the question.
- What are the strategic words or phrases?
- What is the subject of the question?
- Focus on the data in the question; is there abnormal data?

OPTIONS

- Read every word.
- Focus on the subject and data in the question.
- Consider available resources.
- Use the process of elimination.
- Are there any closed-ended words in the options? Eliminate these options.
- Are there comparable or alike options? Eliminate these options.
- Are all components of the option correct? If not, eliminate the option.
- Is the option a nursing intervention rather than a medical one?
- Is there an umbrella option? If so, this may be the correct option.
- Are there concepts in the question that are comparable or alike to concepts in an option? If so, this may be the correct option.
